13215. (By Lord Barnard.) Has that been going on for a great many years in the United States, or is it a new development?—It is a system that has taken a considerable time to grow up. The first allotment out of the public funds was the Act of 1862 in the States, but it has been gradually developed. I have given a map there showing the exact position of each of the institutions. I visited certain colleges, but my attention was more directed to experimental stations and I gave a resumé of the work they were doing. I did not form altogether a favourable impression of many of those experimental stations. I think there was a great deal of duplication of work and a tendency, I thought, to advertise particular men, which is a pattern rather for warning than for example. That was in 1893. I have not had an opportunity of being in the States since then.

13216. Is public opinion in favour of the system in force there?—There are changes of opinion from time to time. The whole system of agriculture is so very unlike our own that I do not think the United States could be taken even as nearly as France as an example for ourselves.

13217. Do you think we might increase our demonstration plots?—Yes, quite apart from a certain limited number of research stations. I am sure that teaching through the eyes is worth many times teaching through the ears. That is one way in the United States of familiarising farmers with the results of experiments and getting them to go and see with the eyes what has been done in the country.

13218. Do they go very much?—Yes. Particularly in the State of Wisconsin, I noticed they had a good system of farmers' meetings all over the State there, and there is a very large attendance at the experimental plots. It is the same also in Canada. There is a good deal of that kind of thing going on there as well.

13219. As we know, the interest of farmers in England in that kind of thing has very much increased?—Yes, very much.

13220. We might with advantage develop that system and it would be appreciated?—It would; it would be a very valuable development.

13221. Have you visited any Colonial colleges?—I have been twice to Canada. My first visit to Canada was in the year 1884. Matters were in a very elementary stage then, but they were opening out the north-west, and the experimental stations were very useful there, but the experiments were limited to a great extent to supplying the kind of

3 July, 1907.

seeds and plants that were suitable for particular districts where very little was known, but there again I do not get much example for our work here. We have a great body of tradition as to what suits particular localities which in a new country does not exist and has to be manufactured, and farmers have to be taught, but here we can do without that elementary instruction.

13222. What is your opinion with regard to sugar-beet growing?—That would be a new type of agricultural industry altogether in this country.

13223. (*By Mr. Medd.*) Have you ever met Dr. Robertson?—Yes, I have met him and had very interesting conversations with him. He has done and is doing a very valuable work.

13224. He was a Commissioner of Agriculture and is now managing the Macdonald Schools in Canada. Would you recommend this Committee to invite him as a witness in the event of his being in England?—I think any information or suggestions he could make would be of great value, and Dr. Saunders I would recommend also.

13225. Yes, but he is a very old man to ask to come?—Yes, he is getting an old man, but he has a great store of knowledge with regard to this experimental work.

13226. (*By Lord Barnard.*) The information you have given us as to the United States of America refers to the period when you were there a great many years ago: you are not, strictly speaking, acquainted with the present state of affairs?—Quite so. I have had no means of following the development, although I know it has been very great.

13227. I think with your knowledge you perhaps might be able to tell the Committee whether the system of giving these grants has ever been attacked in the House of Commons, and if so whether violently or whether these grants have generally passed without much comment?—There have been two or three lines of criticism. The earliest was almost entirely confined to the question of the duplication of grants. If the Committee have followed my evidence they will have seen that there were several different avenues, first through South Kensington, then through the Treasury, and then by the Board of Agriculture direct grants, and then the County Council residue grants. So that there were four channels by which money raised from the taxes could reach educational institutions. I gave a good deal of attention to the endeavour while I was at the Board of Agriculture to get rid of the danger of undue duplication of grants given to agriculture, and as to the need of information as to which counties were giving grants for that purpose. The more general criticism was that not enough money was spent, and a desire was expressed in the House that the Board of Agriculture should have larger means if the Treasury would only allow it. There was also some criticism of a local character now and then where individuals thought their own county should get a larger share.

13227a

13228. The system of giving grants to these colleges, as a system, has never been seriously attacked in Parliament to your knowledge?—Not to my knowledge, and I think I should have known if it had been.

13229. Would you favour one channel only instead of four, all of which are still in existence, I understand—would you suggest that all the money should go through one channel in future for this purpose?—It would be very difficult to carry that out as a matter of administration. If I had a clean sheet of paper, and the whole system were being started again *de novo*, one channel in my opinion would be better than two or three, but you have the Board of Education charged with certain responsibilities, and you cannot prevent it, and I think the only effort should be in the way of preventing duplication. If it were possible to confine the money going to agricultural education through the Board of Agriculture I should prefer it, if it could be done.

13230. Are there any other points you would like to mention?—There is just this point I should like to mention with regard to the foreign examples, that there are other countries to which your attention might usefully be directed, one of which is Denmark. There are memoranda from several of those countries in the Report of the Small Holdings Committee. The Danes practice what I mentioned at the beginning of my evidence, that the first step should be that the ordinary education of a boy who was going to be eventually trained in agriculture should be thorough. Another country to be considered is Hungary. I cannot give any details of it, but I have been once or twice to Hungary, and have been much impressed with

good results from the system of agricultural education there.

13231. (*By Mr. Medd.*) There is a Report by the Essex Committee on Hungary which will be available for us?—Yes.

13232. Would not you suggest Holland?—I have no personal acquaintance with Holland on this subject. I do not know either Holland or Belgium, unfortunately. Hungary I have visited, and I have also seen the Museum and general arrangements of the College in Berlin. I have also been in Russia and seen the attempts to deal by object lesson with the different types of breeds and machinery and so on, but not through schools. The Hungarian system has this advantage, that they are the only country in Europe that has very materially increased its yield of the grain crops within the last 30 years. We have done nothing of that kind here, and the results go further than Germany or France. The figures are a little uncertain, and I am at the present moment in communication with the Hungarian Government on the subject, but I know that the wheat crop has been doubled in yield in some cases.

13233. (*By Lord Barnard.*) Is not that possibly because they are only gradually levelling up to a point which English agriculture reached a good many years ago?—Your lordship is perfectly right. They started with about 8½ or 9 bushels to the acre.

13234. (*By Professor Middleton.*) You referred to the fact that the systems in France and England were different; that England had developed in a certain direction, and that we could not therefore imitate the French system even if we wished to, but I think you will agree with me that although the systems in the two countries are different the directions in which we have developed are not so very different. We have got an institution in England, the Agricultural Department of the University of Cambridge, which I think we might compare pretty well with the National Institute in Paris, which does the same sort of work, and is competent to do the same sort of work?—Quite so, but we have not one institution for the whole country training professors.

13235. That is so, but we have the machinery here?—Yes.

13236. We can get at the same result by another process?—Quite so.

13237. We have also local colleges corresponding to the *écoles professionnelles*?—Quite so.

13238. (*By Mr. Medd.*) You mentioned the central agricultural institution in Paris?—Yes.

13239. You approved the character of the work?—I did.

13240. How far do you think a central institution of that type could carry on the work done for the National Diploma in Agriculture?—I have not had occasion to think of that myself. I think the National Diploma is rather a makeshift for co-ordinating work of the several colleges because they are so scattered and varied in the methods.

13241. Kindly turn to the map behind you. With the exception of the white area down there from Warwick to Cornwall, the country is covered with schools of the type of Grignon?—Yes.

13242. Most of those are of the higher type of local college corresponding to Grignon?—Yes.

13243. We want our white area in Gloucestershire coloured similar to those other areas. Do you not think Cirencester would form the best collegiate centre for those surrounding districts?—I have often wished it could be done in that way, but I understand the nature of its foundation and the voluntary character of its endowment makes rather a bar to attempting any Government help.

13244. Then we come to the organisation in England below the Grignon stage. Do you not think that we require for a group of counties the *école pratique*?—Quite so, and you have got them in many cases.

13245. I do not know whether you will agree with me that Ridgmont, Basing, and Newton-Rigg correspond to the lower class, the *écoles pratiques*?—Basing is the only one that I know personally.

13246. You think that does?—Yes, I think that one does for farmers attending the short courses—very practical work is done there.

13247. It really is very much like the *école pratique d'agriculture*?—Very much.

13248. The *école pratique* is a continuation course?—Yes, but the work done is something similar.

Major P. G.
Craigie, C.B.
3 July, 1907.

13249. As farming has advanced the *fermes écoles* have disappeared?—Yes, but they were useful at one time—in 1884 they were doing some very good work.

13250. I take it you have not come in contact with any *écoles primaires supérieures*?—No; I have not personally visited those.

13251. There is one at this place, Onzain, which is perfect?—I have heard of it by name, but I have not visited it.

13252. They are the type of schools which our counties could set up because they afford an opportunity of teaching in three branches, of agriculture, commerce and industry. They are of a lower grade naturally?—I could not give any evidence with regard to them because I have not inspected them.

13253. In France, of course, you have come in contact with the general work of the Boards of Agriculture and Education?—Yes.

13254. Have you found any friction between them?—There was a good deal of friction when I was there. I visited the officials of both departments, and that is one of the difficulties that arises, very much what we have met with here. I dare say they have got over it now, but just

then there was some friction. It was very difficult to define where the functions of one department ended and where the other began.

13255. I agree, but do you think the work suffered?—I think there was a little delay in starting the work there through the local jealousies of the two departments.

13256. I am in favour of everything in the nature of agriculture being in the hands of the Board of Agriculture. Your experience in France is that it works unsatisfactorily?—The *écoles primaires supérieures* would be more directly under the Board of Education in France.

13257. Yes, and the Central School at Paris would be under the Board of Agriculture—and Grignon?—Exactly.

13258. And you would put the *écoles pratiques* there?—Yes; they are so now.

13259. Where any difference exists it seems to me it is only in so far as the work is common, as for example in the *école normale*, where the Professor of Agriculture comes in to give agricultural lectures, and to some extent in the higher elementary schools—but otherwise is there any friction?—There are differences in the constitution of the educational bodies of the two countries which I think it would take too long to explain here to-day.

Mr. WINDHAM E. HALE, called and examined.

Mr. W. E.
Hale.

13260. (By Lord Barnard.) You are a member of the Lancashire County Council?—Yes.

13261. And Vice-Chairman of the Agricultural Sub-Committee of that County Council?—Yes.

13262. Is that Committee a Sub-Committee of the Education Committee?—It is representative of the three bodies—the County Council, the Harris Institute and the County Agricultural Society.

13263. Have you lived long in Lancashire?—All my life.

13264. You have been associated with the agricultural industry?—All my life.

13265. Will you kindly tell the Committee what is being done in Lancashire at present with regard to agricultural education?—The Secretary of Agriculture, Mr. Porter, will answer any details you want later, and therefore I think if I tell you roughly it perhaps will be sufficient for what you may require. The work carried on by the County Council may practically be divided under two heads—the education of those who are going to farm, and the education of those who are farming. The education of those that are going to farm is chiefly carried out at the Harris Institute and at the Hutton Farm—that is the County Council farm close to Preston, and within easy reach of the Harris Institute. At the Harris Institute the higher education is given, and at the farm it is chiefly the dairying and poultry work.

13266. You include women as well as men?—We do; I may say, to begin with, that one of our chief difficulties, both in the education of farmers and of the pupils at the Harris Institute, is the want of education; when I say the want of education I mean the want of proper education before they come there. That is, as far as the pupils at the Harris Institute are concerned, the elementary education does not meet the requirements of the Institute, and as to the farmers themselves, of course their education is practically the same.

13267. At what age do you take students?—They come at all ages, but we take them at the Harris Institute at 14.

13268. Most of them have not been to any other school except the elementary school?—No.

13269. You complain of the quality of the education which they have had at the elementary schools?—Yes, they know practically nothing of agricultural education. They simply know what they actually learn at the elementary school, and that is not sufficiently high to enable them to step straight away to the education we give them at the Harris Institute, and therefore there is some missing link somewhere.

13270. How long is it since the Harris Institute has been established?—A good many years now.

13271. Was it started by public funds, or is it endowed?—It is partly endowed and partly by public funds, the Preston Corporation, ourselves, the Board of Education

of course, and the Board of Agriculture as far as the agricultural part is concerned.

13272. You have rather touched upon this question of the fact of there being a gap, in what way do you suggest that gap ought to be filled?—That is my own idea, of course. In Lancashire especially there are many grammar schools which at the present time are doing very little work, and I think they might be used very usefully in the rural districts, both for commercial and agricultural education, which would be useful to the people who live in that district, instead of teaching farmers' sons and cottagers' sons Latin and Greek. I am glad to say Mr. Dymond, who visited one of our schools of which I am a trustee, the other day, is very anxious to meet our views on the subject.

13273. Have not most of those schools been re-modelled of late years?—They never got beyond the grammar school pure and simple.

13274. We are rather wandering out of our own line, but as the question of the education on which you base the technical education afterwards is important, we had better have it. I may tell you that I was for ten years in the Charity Commission, and I should have thought from my own experience of the last 25 years that all the secondary schools in England since the Endowed Schools Act had been re-organised?—Yes, but none of the schemes have practically got beyond the ordinary grammar school teaching.

13275. You think the ordinary grammar school teaching is not a good education to base it upon?—Not from an agricultural point of view.

13276. Are you of opinion that these schools might be made suitable?—I think they might be made very suitable?

13277. Now will you proceed to tell us further about the Harris Institute and the courses of education that are given there?—At the Harris Institute the education is the higher education required not so much for farmers, but for those who are practically going to take up the teaching of agricultural subjects to a great extent. At the present moment there are many subjects taught there which are, from a farmers' point of view, more than will ever be likely to be required, but still that is the teaching.

13278. (By Lord Belper.) You give no instruction in practical work there?—No; unless they have been farmers' sons they have had no practical work, but we have this year passed a resolution that anybody who applies to come there must show that they have had six months' practical training on a farm before they are eligible.

13279. (By Lord Barnard.) Six months' work on a farm is a very short period, is it not?—It is, but up to the present time they have had none.

13280. Most of the witnesses we have had before us have told us that they were of opinion that two years' practical

Mr. W. E.
Hale.

3 July, 1907.

work on a farm was necessary to enable a boy to receive real advantage from scientific training afterwards?—I quite agree with that.

13281. The system which has been put before us and which many of the members of the Committee have, I think, more or less in their own minds adopted, is this, that a young man who is going to farm should first of all have a good general education, that it is indispensable that he should have at least two years' practical work on a farm, probably on his own father's farm, and then that he is well qualified to receive further information and knowledge through the medium of short courses or lectures at such an institute as you have?—That is just what we require—for farmers.

13282. In your case I understand the lads go straight from the school to the Institute without any practical knowledge?—Yes, and they practically have four years' courses.

13283. (*By Mr. Latham.*) Which six months in the year do you mean they should be employed on the farm?—That is a very difficult point to settle. Our course practically runs through the winter months, so that it would be in the summer months that they would be on the farm.

13284. (*By Lord Barnard.*) How long does a student remain at the Harris Institute?—For a full course of four years; but we have short courses for those who do not wish to take the National Diploma.

13285. I do not quite understand what these students, either men or women, who have been four years at this Institute, are likely to do in after life?—The best of them, of course, hope to take up agricultural teaching as a means of livelihood.

13286. That only provides for a very small proportion of the people who want instruction in agricultural science?—Yes.

13287. It does not, except here and there, in individual cases, touch the working farmers?—It does not—I was coming to that later. I think the short courses is a system that ought to be encouraged.

13288. (*By Lord Belper.*) Do you really mean you give a long course of four years without any practical instruction in agriculture at all?—Unless they are farmers' sons there is none at the present time.

13289. What earthly good can it be to give a man four years instruction in scientific agriculture unless he has a thorough grounding in practical work?—I do not think there is much.

13290. I take your answer—That is the point where I think it ought to be improved.

13291. You do not agree with your present system, then?—I do not.

13292. (*By Lord Barnard.*) Do any of the students go through a shorter course than four years?—A good many of them.

13293. I do not mean a short course, I mean a one year, a two-year, or a three-year course, and so on?—Yes, they do. Mr. Porter will give you the figures later on. Of course, all the pupils do not come at the same age by any means.

13294. I think I had better ask you to give us your views in your own words rather than put questions to you?—Very well.

13295. (*By Mr. Latham.*) Will you just tell us what paragraph 3 means: "No practical farm work is done by the students while at the Agricultural School. Those students who are the sons of farmers usually go back to their farms in the summer, and those who are not the sons of farmers are advised to engage themselves in practical farm work when not in attendance at the agricultural school"?—The courses do not run all the year. The session only runs for a certain number of months, and during the other months there is no school held at all, and therefore they have four or five months in the year in which they could go to these farms.

13296. You have no control over them in that respect?—No control over them at all at the present time.

13297. (*By Lord Barnard.*) I suppose your school is really a scientific school with an agricultural bias?—That is practically what it is.

13298. Now will you give us your views as to the agricultural education of the older farmers?—That in the first instance was either done by lectures on the different subjects of interest to farmers by a migratory school going round teaching butter making, and by a scientist in cheese

who visited the farms and advised on the management of the dairy and the making of cheese.

13299. You state that farmers are sometimes impatient of information which is mainly of scientific interest, and which has little direct bearing on the practical work of the farm?—That is where, of course, we have found the greatest difficulty of all. Lancashire, of course, has not suffered like many parts of England from agricultural depression, and for that reason, probably, they still have gone on farming in the same way as their fathers did, and made money before them, and they have made money to a certain extent, although perhaps not so much as they might do.

13300. Are you acquainted with what has been done in other counties in England?—Yes.

13301. Do your organising people visit other counties and so on?—Yes.

13302. So that with regard to the education of older farmers, and also with regard to the work carried on in the Harris Institute, it strikes me you adopt different principles from what other counties adopt, and the result is, in other counties where different lines are followed, they do not seem to meet with the same difficulties as you meet with, apparently?—As I said before, Lancashire is a very peculiar county to deal with, and the Lancashire people are very peculiar people to deal with, but I must say myself my own opinion is that from a lecture farmers do not derive much benefit. The only way to get the farmers to understand what is being done is to show them on the ground what the results are of what you are telling them. Up to a year or two ago the whole of that was done at the Hutton Farm. That farm is near Preston, and it was a very peculiar farm with regard to soil, and in one way and another the farmers of the county did not go down there and did not appreciate what was being done. It did not meet their requirements, and that farm now is simply used, or nearly simply used, as a dairy school. We are carrying out new demonstrations all over the county, and I think that the farmers are beginning to appreciate what is being done now, and are prepared to take advantage of it; but certainly up to the present time, while the work was carried on by lectures, I do not think the farmers benefitted a bit.

13303. Perhaps you will agree with the evidence which has been given by a great many of the witnesses before the Committee that lecturing is not an ideal way of imparting information, but I wonder whether at the same time you will agree with what other witnesses have said that lecturing is not a bad method of introducing the subject to the agricultural community and making them acquainted with what can be done and of creating interest?—I think a lecture in a district certainly does that.

13304. That must be followed afterwards by other means, such as the word you mention here "correspondence," for instance?—Yes.

13305. Do you get many farmers to correspond with you?—They are beginning to do so now, but they do not like writing, and they never will write if they can possibly meet you.

13306. Do your staff go over farms at all and meet farmers on their own farms?—Yes, that is our chief thing. Any farmer now who is in any trouble, or who wishes to try experiments, has only to write, and we will go and carry out the experiments for him on his farm if they meet the requirements of the district.

13307. A great deal depends on the tact of the organiser or lecturer or whatever he is?—Everything depends on the man who demonstrates.

13308. Some get on very much better and are more capable of administering information to a farmer than others?—Yes, and that happens to be one of our misfortunes. We have had men who did not understand the people and who did not get on with the farmers.

13309. As a matter of fact, the whole thing is in process of development. You cannot consider that you have reached a stage when you can say positively this or that is a thing which ought to be done definitely?—No. As I said, I did not agree with our present system, and I think it will very likely be changed, and I have pointed out how I think it might be changed.

13310. There is nothing like experience?—There is nothing like experience.

13311. On Page 2 of your *précis* you say, "Generally speaking, it may be said that the farmers are willing to consider education which is of a practical kind and which has a direct bearing on the work of the farm." Is not that fact recognised by this Committee of which you have

Mr. W. E.
Hale.

3 July, 1907

spoken?—Yes, it is now, and it has been for the last few years.

13312. Only recently?—It is only recently that we have taken it largely into account. Of course it has been a question of cost to a great extent.

13313. Do you propose to develop this work; do you think it could be developed?—I think it may be very largely developed, but we have not the money.

13314. The Harris Institute is intended for a good many people besides agriculturists?—Agriculture is only a very small portion of the work. It is simply the way that we at the present time have to carry out our agricultural instructions.

13315. What is the acreage of this farm at Hutton of which you have told us?—About 150 acres.

13316. Is it rented by the county?—It is rented by the county, and it is where we hold our dairy schools and poultry classes.

13317. The dairy school and the poultry classes have nothing to do with the Harris Institute?—No.

13318. What dairy work do you do—have you a migratory school, or is it all done at the farm?—We have a migratory school in the county in addition to the farm at Hutton.

13319. Do you find the dairy school has been attended with success?—The dairy work at Hutton has perhaps done more for the county than any other part of our agricultural work.

13320. Do you think more butter is produced, and of a better quality?—We are practically cheese makers in Lancashire, and, although we have had a great many classes going for the last 15 years, I do not think the butter generally has been improved, simply because you have to educate the people to know what good butter is, and you cannot educate them to eat good butter. I have put better butter on the market, but because it has been made at the County Council farm and made good, it will probably be the last to be sold, because they prefer their butter made in their own way.

13321. What do you do for cheese making?—At Hutton we make nearly every known cheese, but of course our one great cheese is the Lancashire cheese—our own county cheese.

13322. Do you in any sense supply the enormous population of your county with cheese, or does it come from abroad?—A good deal of it, of course, comes from abroad. In some parts of Lancashire you will not find a bit of Lancashire cheese, everything will be American, whereas in other parts they will not look at anything but Lancashire cheese. It all depends on how the people have been educated.

13323. Is there much export trade?—I am unable to say how far cheese is sold out of the county.

13324. Is it increasing, do you think?—I cannot say; most of the cheese that is made is sold to the factors and re-sold by them to the grocers, &c., but chiefly, I should think, in certain towns in the county.

13325. What fee is paid by the students to the dairy school?—We charge no fee at all. The whole of the education at the Harris Institute is free, and we also pay the expenses of the students each day if they come by train, or we allow them 10s. a week towards maintenance if they take lodgings in the town. At the Hutton school everything is free, board, lodging, and education.

13326. How do you select the candidates?—They have to apply and they are chosen in their turn.

13327. Anybody practically who applies can get these benefits?—Anybody in the county can get the benefit of it.

13328. Irrespective of his or her being likely to receive special benefit from such a course?—Yes. Of course we have our Selection Committee, and we always make a point of taking farmers' children in preference to anybody else's.

13329. I presume the Harris Institute education is rather expensive?—The agricultural work at the Harris Institute costs just over £1,000 a year. The county pays £650 of it; the fees amount to £46; the Agricultural Department gives £150, and the Education Department £227.

13330. Do you think it is a good plan to give an expensive education to anybody who applies for it irrespective of their capacity for deriving benefit from it?—No, I do not. I am strongly of opinion that anybody who wants to use an education not for their own particular and proper trade, but to improve their position ought to pay for their education.

13331. Take the analogy of the scholarships at Oxford and Cambridge, where certain educational benefits are offered either at no cost at all, or at a very much reduced cost. In that case only the most suitable candidates are selected, and then principally by examination so as to ensure that that benefaction will not be thrown away?—Of course the great difficulty about that is the difficulty with the ratepayers. When you are using ratepayers' money, one ratepayer says, "I have as much right to send my daughter there as another ratepayer."

13332. Does the county give higher scholarships?—Yes, there are higher Scholarships which are carried away.

13333. You have often heard of the "ladder" of education?—Yes.

13334. Do you not think it would be a good plan if it could be arranged that facilities should never be wanting at the expense of the public for an exceptionally clever boy or girl to derive educational advantages by means of scholarships?—I think that is quite right.

13335. Is not that a more ideal system than the system of giving free education to everybody who applies?—I quite agree. I do not believe in giving education to everybody, whether they are fit to receive it or not.

13336. Do you do much in poultry work?—A good deal lately. People are beginning to take a great interest in it, and I think that work will develop very much.

13337. Is poultry keeping very much of an industry amongst Lancashire people?—Very much so, and it is only beginning.

13338. Is there a good market for poultry in the large towns?—Yes, we have a good market for everything.

13339. You are well provided with railways and means of communication, and it ought to be a profitable industry, if it is taken up scientifically?—I think it will be very much so. I may say in the dairy work the man who has really done more good in the cheese industry probably than anybody is the man who has visited the farms. He is not a scientist, but he is a man who understands the whole detail of the work, and when anything goes wrong at a farm a farmer sends for him, and he visits there, and may stay there a day or a week or more as required, to try and put them in the right way, and since he began he has visited something like 4,000 farms.

13340. How did that system start, do you recollect?—No. I am afraid I was not on the Committee when it first arose.

13341. Do you not think that might be extended in other directions?—I think so entirely. In fact, I moved at the last meeting of our Committee whether the whole system, especially as far as cheese making was concerned, could not possibly be extended, and if we can do it in one case we shall certainly do it in the other.

13342. I was thinking perhaps you might assist farmers in other directions besides cheese making?—We have the experiments all over the county.

13343. I mean whether the same system might not be adopted of your agricultural expert being at the beck and call of every farmer who wishes for information on some particular point?—He is at the present time.

13344. Has that been largely taken advantage of?—It is beginning now.

13345. And probably will be more so?—It will certainly be more so.

13346. I see you spend a great deal of money on agricultural education in your county out of the "whisky money" comparatively with other counties. Are you satisfied that the whole of that money is judiciously and well spent?—The £10,000 a year?

13347. Yes.—Yes, I think so: the dairy work is certainly good.

13348. You spend nearly £3,000 a year on that?—£1,200 on the dairy.

13349. (By Lord Belper.) As a matter of fact, Lancashire receives the largest grant of any county in England by far—£38,700—and Yorkshire, the next largest, is £29,000?—Yes. Of course, our agricultural work is a very small portion of our general technical work in the county.

13350. (By Lord Barnard.) What number of students do you pass through the dairy school, for instance, in the course of a year?—Since 1892 we have passed through the dairy school nearly 1,100.

13351. (By Lord Belper.) Is that in butter making or cheese making?—That is the dairy school; they are

Mr. W. E.
Hale.

3 July, 1907.

all taught butter and cheese making. For the butter alone at the migratory school there were 3,700 in the same period.

13352. With regard to your dairying, some large sum has been spent, no doubt, but I am afraid your evidence shows, as far as butter making is concerned, it is not likely to be largely appreciated by the farmers if you cannot sell your butter when made at a good price in the market?—When we first started we had three teachers; at the present time we have only got one.

13353. What is your comment on that, that one is better than three?—That the work in butter making has fallen off.

13354. I suppose that would certainly be the case if farmers find by making the butter themselves on their own system they can get higher prices than by adopting the system that is taught in your school?—Quite so.

13355. I suppose you would not be surprised to know that in colleges within my own knowledge they invariably get the highest prices in the market for the butter which is made there?—I quite agree—if you can educate your people to eat it.

13356. You agree that your system wants reorganising and reconstructing altogether with regard to the teaching of butter making?—Except in those districts where there may happen to be a demand for it, we do not hold any classes at all: we are only filling up the demand at the present time.

13357. With regard to cheese making, do you find that the farmers who have taken advantage of your teaching get a higher price for their cheese?—There is not the least doubt of it.

13358. Therefore that is satisfactory?—That is very satisfactory.

13359. Do you teach the making of any cheeses except the local cheeses that are made in Lancashire?—At the school we do.

13360. All sorts?—All sorts; Cheddar, Stilton, Wensleydale—every make.

13361. Is that teaching appreciated?—I have never found one of our farmers use it afterwards, except those that have gone out to Canada.

13362. You do not have anybody come there to learn cheese making who may be going to take up the making of a particular kind of cheese in the future, or to take up the duty of instructing in cheese making?—Some of our pupils have taken it up with the intention of becoming instructors elsewhere.

13363. But it is not much appreciated by the farmers—other sorts of cheese making?—No. While Lancashire cheese is the good article it is they are not likely to put another cheese on the market.

13364. If they can get a good price for the cheese they have been accustomed to they stick to that?—They stick to that, certainly.

13365. I suppose you agree if agricultural education is to be carried out in a more thorough manner in a large county like Lancashire that it is almost essential that you should have a dairy school, which should succeed in convincing the farmers that by a proper method of butter and cheese making and scientific knowledge they will get a better price for their produce than by going on in their own way?—We do that, of course.

13366. At present you do not reach that point in practice?—Certainly. As far as our own butter and cheese is concerned, we are at the top of the market with our own dairy farm.

13367. I thought you said that the teaching of butter-making was not successful for the reason that the people did not like it?—I said unless you educate the people; we have educated the people on our own farm—the Hutton Farm.

13368. The question is whether the public, who are after all the judges as to whether butter is good or not, will give a higher price?—The butter from our own farm always commands the highest price.

13369. You have not been able to impart that liking in other districts?—We have to people round our farm; but if you go to another district or in the north-eastern part, the people in those districts would not buy our butter because it is not to their taste.

13370. Surely in a place like Lancashire, with the largest and most populous towns in England, if you put the best butter on the market it will always fetch its price?—It is very peculiar, but it is not so. They like their own butter best.

13371. I know three much less populous towns where the butter that is made at colleges fetches the best price of any butter in the market?—It all depends on the people you have to deal with.

13372. (By Lord Moreton.) When your expert goes to give advice at a farm, I think you said, he might go to a farm for a day or a week?—Yes.

13373. Is any fee charged for that advice?—No.

13374. Have you done anything in your county with regard to the teaching of farriery?—No, we have not. We have had the question put once or twice, but we have not so far been able to do anything with it.

13375. Are you aware that in many parts of England, almost in most parts of England, very considerable work is done in that direction?—We have had reports from all the counties that have done it, to see how far we could carry it out ourselves.

13376. Is it a question of want of money, or do you consider you are good enough without farriery instruction?—It is partly a question of money and partly a question of what is the best way in which to carry it out, because the different counties, many of them, carry it out in different ways, and for the present there does not appear to be any hard-and-fast lines as to which is the best method.

13377. (By Mr. Lamont.) I see you have your own herd of Shorthorn cows at the Hutton Dairy School?—Yes.

13378. How long has that been established?—Ever since the farm began.

13379. In what year was that?—1892.

13380. Do you do anything in the way of teaching the hygiene and treatment of cows?—Not there; of course we have lectures on the subject about the county; but, as I say, lectures are not a success.

13381. Not at the dairy school itself?—No.

13382. Is anything done in the way of keeping milk records?—Yes, they are very carefully kept.

13383. Have you found over the series of 15 years by careful breeding and keeping a record that you have increased the average milk production of each cow?—Yes, I might say we have; but we have suffered terribly in Lancashire from tuberculosis. We have been struggling for years to try and get a pure herd, but I am sorry to say it has not been a success.

13384. (By Lord Moreton.) What sort of buildings have you got? Are they old-fashioned buildings and very dark?—No; they are supposed to be as modern as they can be.

13385. Are your cattle out often?—Yes.

13386. In winter?—No, not often, except to water, and when the shippens are being cleaned out.

13387. (By Mr. Lamont.) You feed them inside during the winter months?—Yes.

13388. Have you found you have been able to diminish the amount of tuberculosis during those 15 years, or is it still as bad as it was?—That is a question I cannot answer. We have had a most disappointing experience with tuberculosis. We have tried to stop it by testing and getting practically a pure herd; we bought nothing that was not perfectly sound, but after all we found that the young stock was as bad as ever.

13389. (By Professor Middleton.) You alluded to the fact that lectures were not so great a success as you would have liked in the county in the early stages?—Yes.

13390. And that you yourself believe in demonstrations rather than in lectures?—Yes.

13391. You like farmers to see rather than to hear?—Yes.

13392. I take it that those lectures, which were not very successful, were given before there had been much done in the way of demonstration plots?—Yes.

13393. So that the lecturer could not actually refer to work that had been done in the county. He had probably to deal with experiments which had been done elsewhere?—That is practically what it was.

13394. There was no local colouring about the lectures?—No.

13395. After you have had a series of demonstration plots and you send a lecturer round to deal with the results on the demonstration plots, you think they will be a success?—Yes, they will be a success. I was referring to the old system of filling a village school and lecturing for an hour

Mr. W. E.
Hale.
—
3 July, 1907.

or an hour and a half to farmers who had had no better education than they got at the elementary schools, and who could hardly remember anything that was said, or take notes, so that I came to the conclusion that it was a waste of time.

13396. You qualify your statement by saying that the lectures given in the early days were not a success?—That is so, but lectures with demonstrations given on the ground are a success.

13397-8. And even when inside, if on the results of your local experiments they would create a good deal of interest?—Yes, but not the same success as actual demonstrations and lectures on the ground.

13399. You cannot of course get all the farmers to attend demonstrations, and I was wondering whether there might not be in addition the giving of information to farmers by means of lectures in the winter upon the experiments that had been carried out in the summer?—Yes. The local education authority have only to ask for a lecturer to go down and we are only too pleased to send him, and we allow them to choose their own subject.

13400. Lord Barnard referred to the "education ladder." As a matter of fact have not a great many of your Lancashire pupils gone to other places to continue their education?—Yes, I know a number of them have.

13401. It has come to my knowledge that a good many of them go to Edinburgh University?—Yes. Of course, they have to go there to take their degree. Many of the universities, including both Liverpool and Manchester, have not an agricultural degree at all.

13402. There is no other institution to which the Harris students go?—No; not in the county.

13403. You have no entrance scholarships for the Harris Institute?—No.

13404. At one time the Lancashire County Council used to give entrance scholarships, did they not?—There are scholarships still in agriculture, but the education at the Harris Institute is perfectly free.

13405. Do they not award scholarships on the results of the National Diploma examination?—There are certain scholarships which Mr. Porter will be able to give you all the details of.

13406. What measures did you take to try to combat tuberculosis? You referred to the fact that your endeavours had been a failure?—In the first case we tested the whole of the stock on the farm and got rid of those that reacted, and of course the usual disinfecting was done. We got Professor McFaydean and Professor Delphine to advise us on the subject.

13407. You took the best advice you could get?—We took the best advice we could get, and having ascertained that our buildings were perfectly sound and suitable they advised us to buy only under the test, and so we thought the whole of the herd would naturally be sound, but the result was still unsatisfactory, the young stock reacting.

13408. Even the young stock are affected?—Yes. I should say that 75 per cent. reacted when tested, and this notwithstanding the fact that the breeding stock was sound.

13409. At what age?—Up to a year—bred out of sound cows; and I am afraid it is the same more or less all over the country.

13410. (By Mr. Latham.) I should like some more information about the lectures and the lecturers. In one place you are in favour of them, and at another place you are against them. You say on the second page: "The lectures in the county have been the means of disseminating a large amount of information, and much good has been done in this way"?—That is at the later stages. That really ought to be "lectures with demonstrations on the ground."

13411. You have been successful in getting lectures interesting by combining them with demonstrations?—Yes.

13412. And for that reason the farmers have taken an interest in them?—Yes, because they can see, whereas, as I have just said, if you talk to a Lancashire farmer in a room, say, for three-quarters of an hour, his education having been no more than an elementary school education, and hardly ever reading, except probably the papers on a Sunday afternoon—our farmers are nearly all working farmers, and work the same as a labourer—so therefore are not prepared to listen with very much interest, or to read very much after the day's work. I do not suppose any of our farmers, or very few of our farmers, read anything but the paper.

13413. Then it is really not so much that the lectures are at fault as that the farmers are not educated enough to take an interest in them?—The lectures are at fault in so far as the farmers do not care for them.

13414. Then I do not understand what you mean when you say that much good has been done in the way of lectures?—When you can have it in connection with a demonstration and show them on the ground, then the lectures have done good.

13415. That is exactly what I say. When you make the lecture so that they can understand it they appreciate it?—Yes, but you have to provide the picture.

13416. At first you gave the wrong kind of lecture, and when you appreciated what was required by the farmers and gave it to the farmers then they took an interest in them?—Yes.

13417. You say the object of the County Agricultural School is to prepare young men and women for the practical work of a farmer's life, and yet you say there is no practical agriculture taught. How do you prepare them?—As far as the farmer's own children are concerned they are supposed to know their practical work before they come.

13418. That is not exactly what you say. You say: "The object of the school is to prepare young men and women for the practical work of a farmer's life," and then in the next paragraph, the next sentence, you say, "No practical farm work is done by the students while at the agricultural school"?—It certainly does not quite agree.

13419. It absolutely is worse than that?—But I think if you go on that is rather explained: "by instructing them in the principles which underlie farming operations, and demonstrating in the lecture room and on the farm—modern and scientific methods of agriculture."

13420. I want to know, if there is no practical teaching or practical work done, how it is possible to instruct them in the principles? You cannot do that by book work?—I quite agree with you you cannot.

13421. A little further down you say: "Four demonstrators have been appointed, for horses, cattle, sheep, and pigs respectively." Will you kindly tell me what they do?—They are supposed to be some of the best judges of stock in the county, and while these classes are being held at the Harris Institute on certain days the head boys of the class are taken down to their farms, and there these demonstrators give them instruction. If it is a horse, the best horse he has is brought out into the yard and he explains the points of the horse, and, as far as possible, what a perfect horse ought to be.

13422. To some extent that is a slight instruction in farriery?—It is as far as a horse is concerned and the other animals.

13423. (By Lord Barnard.) Does this gentleman show his own horse?—Yes, he shows his own horse.

13424. Then he would be scarcely likely to criticise the points of it, would he?—He is supposed to have a perfect animal.

13425. (By Mr. Latham.) Is the gentleman who shows the horse a veterinary surgeon?—No.

13426. Is he a farmer?—He is a farmer, and is usually a judge at the local and other shows of horses.

13427. Then you go on to say: "The students will then be required to criticise other animals." In what way?—Another horse is brought out, or whatever animal is there to judge, and each boy is asked to give his views upon the points of that horse, and then the demonstrator, having heard their views, explains where they are wrong, if they are wrong. I may say the county Agricultural Society holds at their annual show classes for young amateur judges, and these boys will no doubt take part in them. We find them very successful.

13428. When you get to the cattle, how do they demonstrate the value of cattle?—The same thing is done there. They are pointed out what is as near as possible a perfect beast, and why it is a perfect beast, and then another cow or bull, or whatever it may be, is brought in, and they are asked to point out the good qualities or the defects in the same way as the demonstrator has already done with the first animal.

13429. Are they expected to say anything about the live weights?—I do not know that that has been taken into consideration, but no doubt that will be part of what they will learn.

13430. I suppose the same remarks apply to sheep and pigs?—Exactly.

Mr. W. E.
Hale.

3 July, 1907.

13431. I notice that you give £900 for scholarships. How much is that to each scholarship?—Mr. Porter will tell you that.

13432. You have tried to start farriery classes?—We have not tried, but we have had the matter under consideration.

13433. You have failed to find out that other counties have been successful in their venture in that respect?—No, but we have failed to find out which is the most successful way of carrying it out for the good of the county.

13434. Surely it must be carried out on the same lines as in the other counties?—No, because there are different ways of holding the classes in different counties.

13435. What ways have you heard have been started?—Some have a travelling van; some have held them in a town and some have held them in certain villages.

13436. I suppose we cannot deny that; that was not what I meant at all. What I mean is those who have attended these classes have all been taught to be a better class of smith, and that the shoeing they were practising was either good, bad or indifferent?—Yes.

13437. It would not much matter whether that was done by means of a travelling van or at a centre, the result is the same?—The result is the same, but the question is in a county which is the best system?

13438. There is no system so good as the travelling van?—The smithies are very far apart, you know, in our county.

13439. The van can go to each village. Are the horses so well shod in Lancashire that it is no use trying to improve the smiths there?—I think, generally speaking, the shoeing is very bad.

13440. Then you think there is a demand for that kind of instruction?—No doubt.

13441. With regard to your cheese making and the instruction that you give in cheese making, did that begin in the Institute? You make the remark that it has been found to be more convenient for the farmers to run two classes at the same time. Is that in cheese or butter making?—That is butter making in the migratory school entirely.

13442. You do not give us any information here as to how the improvement in the cheese making started. You simply say: "The teacher of cheese making travels from farm to farm and gives instruction in the farmer's own dairy. It is sometimes necessary to stay for periods of from one to five days at a farm." Then you go on to say about the new system of cheese making. Where did the new system of cheese making come from?—That is the man that I said has done so much good in the county. If a farmer's wife finds that something is wrong with her cheese, and she cannot explain the reason why, and the cheese is going wrong, she writes and asks this man to come and visit the farm. If he can point out in his first visit where the fault is, well and good; but if he is unable to do so, he stays at the farm for as long as is necessary, making notes of the whole of the process of the cheese making as it goes on, until he is able to put his finger on the spot and say, "That is the point where you are wrong."

13443. The man goes and improves her old method of cheese making, but does not start her in a new method of cheese making?—He points out where she is wrong. There is no hard and fast rule for making Lancashire cheese.

13444. You say it is sometimes necessary for him to stay for periods of from one to five days at a farm?—Yes.

13445. Surely you cannot do much in the way of improving cheese making in one day?—He may be able to put his finger on the spot that is wrong in one day.

13446. He goes to the regular cheese-maker and tries to find some defect in the dairy?—He never goes to a farm unless he is sent for.

13447. May that be in consequence of taints in the cheese?—It may be very possibly.

13448. I suppose that may come from the land as well as from the manufacture?—Of course cheese sometimes does go wrong because of an alteration in the manuring of land.

13449. If that had happened, would this man be scientific enough to find that out?—Yes, in conversation with the farmer, he would. If he could not make out what was wrong, he would ask the farmer leading questions

until he discovered. Of course cheese will go wrong if you bone your land too heavily.

13450. Do you suggest he would find that out in four or five days?—Yes, I think he would be able to find out in five days or inside of a week what was wrong with the cheese. Of course, you understand there is the cheese making at the County Council farm as well.

13451. Yes, I perfectly understand that, but you do not tell us in your *précis* what you do at the County Council farm to teach cheese making. You say something about the butter making but not about the cheese making?—We have two recognised experts at the County Council Farm, and the pupils come there and stay there for their course.

13452. You actually have cheese making going on principally at the farm in certain periods of the year?—Yes. I think I said over 1,000 pupils have passed through the cheese making course.

13453. With regard to butter making, Lord Belper drew some wonderful things from you. You say your own butter was the last butter in the market that was sold?—I say if there are no people educated to that taste in the district, your butter will be the last in the market.

13454. Where it is known the butter from your dairy school always takes prominence and always makes the best money?—Yes, where we have educated the people to eat it.

13455. If the butter from the farm makes the highest price where it is appreciated, through some unfortunate cause which you do not explain to us, your butter is better, but the people will not eat it?—Because the majority of people in Lancashire do not like good butter, but there is a minority who do like good butter, and up to the last few years they have been unable to get good butter made locally, and now they can get good butter, myself amongst the number. I could not eat the butter that many farmers make, but most people in the towns would not eat the butter I eat.

13456. May I ask where the butter comes from that supplies the Lancashire markets?—A great deal of it is made in the county.

13457. Not foreign?—There is a good deal of foreign butter too.

13458. Cannot we Britishers make it as good as the foreigners?—I do not like foreign butter, but the people in the county do.

13459. I should have thought the butter industry under the improved education was, perhaps, the finest in the world?—I quite agree with you. I think it is the finest.

13460. Even now you say Lancashire people do not appreciate the finest?—Yes, I say that.

13461. Do you think their taste is improving or not?—I think in time the taste will improve, but it is very slow.

13462. I was struck with the number of these individual students you gave us. Do not they go home and make butter in their own houses?—My own experience is that a good many of them do not.

13463. Then a good deal of money is thrown away on the butter school?—Yes.

13464. Do you not think that is very much to be deplored and very much the consequence of your free education?—I quite agree with you. I do not believe in free education myself.

13465. If these people had to pay money to come to the butter schools they might just possibly think better of it and you would keep the undesirables—I will use the word—away?—Yes.

13466. I can see very little use in public money being expended on free education which is not appreciated afterwards?—I quite agree with you.

13467. With regard to the students you get at the school, do you find the majority of them take up agricultural life afterwards?—At the Harris Institute or the Dairy School?

13468. At the Harris Institute.—At the Harris Institute about a little over 50 per cent. of the pupils are of the farming class and about 60 per cent. of the pupils go back to the land.

13469. Then the whole farming class and a few of the others go back to the land?—I will not say the whole of them, but the large proportion do.

Mr. W. R.
Hale.
—
3 July, 1907.
—

13470. With regard to the general education in the county, you made the remark that the majority of the people at the Harris Institute came from the elementary schools?—I should say so.

13471. Do they go to the secondary schools?—No, very little.

13472. Are your secondary schools up-to-date and what you require?—No. I think I said to begin with that the education in secondary schools in rural districts might be made much more useful to the people in the districts in which the schools were situated.

13473. Have you any agricultural education at all at any of these secondary or grammar schools?—No.

13474. You do not advise it, I presume?—Yes. I said at one of the schools Mr. Dymond has allowed us to make a certain change which will be carried into force very shortly. It is a school adjoining my own house, and I have got them to allow this to be tried, and I think it is a step in the right direction.

13475. Do you not think it is almost impossible to carry on an agricultural side at a secondary school?—You cannot carry it on entirely as an agricultural school. You must be in connection with other branches of education.

13476. I quite agree with that, but if you have an agricultural side to a secondary school it must be kept pretty much for one part of the students, must not it?—Very much on the same lines as the modern side at a public school.

13477. (*By Mr. Medd.*) Can you kindly tell me the constitution of the Harris Institute?—It is a technical school.

13478. It teaches a variety of subjects?—It teaches every subject.

13479. Can you tell me the number of agricultural pupils?—It averages about 70—Mr. Porter can tell you more definitely.

13480. The late Chairman of your Education Committee, Mr. Wood, has done a great deal for the early education, and the promoting of nature study in continuation schools or day schools?—In day schools.

13481. So that we are face to face with this fact in regard to Lancashire that you have nothing of a permanent value beyond what may be done in a day school or a continuation school, or these varieties at the Harris Institute—you have nothing beyond that, have you, in the county?—No.

13482. Do you not think that by amalgamating with other counties adjacent to you, such as Derby and Cheshire you might facilitate your work greatly, and carry it on at less expense?—I do not think so.

13483. How are you to provide any permanent intermediate education, or any higher education in agriculture?—It all depends, of course, from what point of view you look upon the education. Do you look at it purely from a farmers point of view?

13484. Yes, purely from a farmer's point of view. You would agree with me probably that a farmer as much as a scientific man in any branch of industry deserves the highest technical instruction?—Yes.

13485. You cannot give it him at present, can you?—I do not follow you. As a farmer pure and simple I think we are quite capable of giving all the education that is required at the present moment.

13486. Where?—Do you mean practical education, or technical?

13487. No, the two are indissoluble. You cannot have your man of theory entirely fit either to guide or instruct farmers, nor, on the other hand, can you have your man, who may win prizes at the Royal, and everywhere else, capable of instructing your best farmer. The two are indissoluble—do you not follow me?—No, because I do not think that from a farmer's point of view you require the education that you do for a man who is going to be a teacher on the subject.

13488. Wherein is the difference?—I think what a farmer requires to be of use to him is a very different education from that which you would require if you were going to educate teachers on the subject.

13489. Yes, I grant you that the actual cultivator of the soil need not necessarily proceed to the same grade as the man who is to experiment and to teach agriculture. The two things are distinct, but if he wishes to learn how to experiment, how to conduct research in agriculture,

and how to be a teacher of the farmer, where within your county has he the opportunity of learning it?—Nowhere.

13490. The necessity for it exists. There is a project now—we had the witness before us the other day—of forming an agricultural department in connection with Manchester University. Such a department would be to that part of England what the department at Cambridge is to the Eastern Counties. Do not you agree with me that you not having at the Harris Institute anything so purely agricultural as Holmes Chapel, that you, Derbyshire, and the Harris Institute might co-operate—it need not entail any great expense upon each individual county—as those other counties on that map have done, round such a collegiate centre as Manchester?—I may say Liverpool are trying to do exactly the same thing.

13491. I know. I have been afraid they would want to, and they are more difficult of access than Manchester?—They both want a Chair of Agriculture.

13492. They have not applied to you?—No, but they have asked some of their citizens to endow one.

13493. For you, and for the rest of the two counties, the Holmes Chapel and Manchester are more convenient centres. You have got your own for work of a different type?—Yes.

13494. You do not want to create all these types in each county because each county has not the money to do it?—At the present time we only rent a farm, but it has been under consideration for some time, and I consider it the right thing that we should buy a farm.

13495. Yes, but from all the evidence you have given to-day the agricultural instruction at the Harris Institute carries a man a very little way?—Except on the scientific side.

13496. You really want it supplemented. Of course, a student could go to a collegiate centre, such as Reading, but if he had one within his immediate neighbourhood it would be easier for him, and easier for the combined counties. However, it is only a project, and you have not formed any opinion on it?—I do not think for a moment that we could work it in with any of our neighbours: it is inconvenient.

13497. I do not see why it is more inconvenient for a lad to get from Warrington to Liverpool than it is to get from Warrington to Preston?—I thought you were talking of Holmes Chapel.

13498. I said of a different type. Holmes Chapel is of a higher agricultural type?—Of course we do not consider it is of a higher educational type than our own.

13499. (*By Lord Barnard.*) Can you tell us what your annual expenditure is?—I have a balance sheet here for last year. The total expenditure for last year is £9,316. At the beginning of the year commencing on 31st March, 1906, we had cash standing to our credit, £620: during the year we sold produce amounting to £2,750: the vote for agriculture was £8,000: that makes £11,370. Our expenditure is divided under three heads, for the County Council farm, dairy and the poultry school the expenditure was £5,327.

13500. The dairy and poultry school is carried on at the farm?—Yes, all three are carried on at the farm. The Harris Institute, £1,348: miscellaneous work in the county including horticulture, migratory butter and cheese instruction, agricultural experiments, special grants amount to £1,069: then staff and management expenses, £1,570: that makes a total expenditure for last year of £9,316, leaving us a balance at the beginning of this year of £2,054. In years past we have always been allowed to keep and carry on the balance to the following year, but this year the County Council said we must return unexpired balances like other committees, and we have had to do so.

13501. What is the number of agricultural students in the Harris Institute?—Sixty-six.

13502. Did I understand you to say that the course was four years?—It is spread over four years I should have said.

13503. Not for four whole years?—No, I tried to explain that there were six months at least when there was no work done at the college, when anybody could go on to the farm.

13504. (*By Mr. Latham.*) Is there any difference in the first year's teaching, and the second year's teaching, and the third and the fourth year?—Mr. Porter will be able to give you the details of that.

Mr. EDWARD PORTER, B.Sc., called and examined.

13505. (*By Lord Barnard.*) What is the capacity in which you appear here?—I am Secretary of Agriculture for the Lancashire County Council.

13506. You combine another office with that. You are lecturer in agriculture, are you not?—I give lectures too.

13507. For the Lancashire County Council?—Yes.

13508. How long have you held that office?—A little over a year.

13509. Where were you before that?—I was a junior lecturer under the same County Council, and before that I was at the Midland Agricultural College.

13510. You have been in the room the whole time Mr. Hale was giving his evidence?—Yes.

13511. So that you heard it?—Yes.

13512. I will, therefore, not ask you a long string of questions but rather would invite you, if you will, to supplement or explain anything that Mr. Hale told us?—With regard to the age of the students coming to the agricultural school I have a return here which might be useful to the Committee. It shows that some came from elementary schools direct to our Institute, but there was also a fair number of others who had been some time away from school working on farms, and in some cases a few had been to secondary schools. The ages vary from 14 up to, in one case, 31.

13513. What do you consider is the usual age, not taking exceptional cases?—14, 15, 16 and 17—we get the larger proportion of students varying between those ages.

13514. You have a good many students who come as young as 14?—21 out of 131 in five years.

13515. Do not you consider that is rather young to commence education of this kind?—I do, but the proportion is not very great—21 out of 131 in five years.

13516. What number come the next year?—21 at 15 out of 131.

13517. And at 16?—21 again.

13518. 17?—23 at 17, and then there is a big drop down to nine.

13519. I understand these boys and girls come for four winters. How long is the duration of the period of instruction?—26 weeks.

13520. The other 26 weeks they are working on their farms, are they?—Yes, many of them do that—those who are the sons of farmers go back to their own farms.

13521. Do you have the sons of other classes besides farmers?—Yes, some come from professional classes and some from other classes.

13522. Do those who are the sons of farmers intend to take up farming?—Yes, as regards the majority, but some have become teachers.

13523. Do you mean elementary school teachers?—No, teachers of agricultural science; some, however, have gone to the Colonies, and some have taken up work which is not at all allied to agriculture. I have a return here showing the subsequent careers of some of the students.

13524. Supposing you have an exceptionally clever student do you hold out any prospects of him getting any further in education, say a B.Sc. degree?—Yes, two students in each year are able to win scholarships which usually take them to Edinburgh or Glasgow.

13525. A scholarship given by the Lancashire County Council?—Yes.

13526. I suppose in the usual way those scholarships are tenable at any place of higher education approved by the County Council?—Yes.

13527. Are there two each year irrespective of the number that require such assistance?—There have been two each year, but the number of students each year has not varied very much.

13528. Two are not too few, are they?—Two are given each year, and this number seems to be satisfactory.

13529. Does the going about to various farms form part of your work?—Yes.

13530. How do you manage to find time for that in addition to your other duties?—Of course in the summer time there is not a very great deal of systematic lecturing: we give lectures at the dairy school in the summer

time, but our time is not so fully employed with lecturing as in the winter, and I visit the farmers in the afternoons.

13531. You go and make yourself personally known to them and that kind of thing?—Yes.

13532. Whether they send for you or not?—In most cases we have some sort of communication before going.

13533. Do you ever attend public meetings of farmers, such as annual dinners of the farmers' clubs, if you have such things in Lancashire?—I have been to one or two.

13534. You do not go regularly?—I have not been very long in the capacity of secretary.

13535. Even when you were assistant you did not go?—No, not as assistant.

13536. Have you an assistant now?—Yes.

13537. Does he never go—is this supposed to be your particular privilege?—I go by invitation.

13538. You go a good deal about amongst farmers?—Yes.

13539. Do you think it is advisable to wait for farmers to move. Do you not think it is advisable for you to move first—however, you think you are pretty well in touch with the farmers?—Yes, I think so.

13540. I see by the return there are a very large number of small holdings of from five to 50 acres in your county—more than in any other county in England—there were 11,600 last year?—Yes.

13541. Do those men earn their living entirely on those farms, do you know?—That is a point I have no information about.

13542. There are very few large farms in Lancashire—only 83 in the whole of that large county of over 300 acres?—Yes.

13543. That is a very small proportion. Do most of these farmers work themselves on their farms?—A large proportion are working farmers. It depends on the size of the farm; the larger farmers do not, perhaps, do much actual manual labour, but the smaller ones do.

13544. They are largely grass farms, are they?—Oh, no.

13545. Are they mixed?—Yes, but there is a large number entirely arable.

13546. Is there any other point you would like to mention to the Committee?—A point was raised with regard to entrance scholarships. I might supplement Mr. Hale's evidence by saying that next year each student will be required to show that they have a fairly decent general training, and on that examination their maintenance allowances and so on will be given to them, so that the standard is being raised in that respect.

13547. They are limited to the county, I suppose?—Yes.

13548. (*By Mr. Latham.*) Are they students that come from the elementary school or the secondary school?—The standard of examination is based on what you might expect a Standard VII. boy in the elementary school to know, but in some cases it is arranged so that any one coming from a grammar school, if he could show that he had the same training, would be allowed to come in.

13549. (*By Lord Barnard.*) When you grant these free instruction privileges, do you take any pains to find out whether the beneficiary intends to take to farming?—One of the conditions on which the exhibitions and scholarships are awarded is that the candidates must be persons engaged, or preparing to engage, in agricultural pursuits.

13550. To turn for one moment again to the nature of the land, I see in the Board of Agriculture returns that of arable land in Lancashire there are only about 200 acres per 1,000, whereas permanent grass is 479—more than double—so that the proportion of grass land in Lancashire is very much greater than that of arable?—That is so, but south of Preston and south-west Lancashire there are large areas of arable land.

13551. Then there must be other parts which are almost entirely grass?—Yes.

13552. And the larger part, almost 2 to 1?—Yes, the eastern part of the county is very hilly and is largely under grass.

13553. Perhaps you can give us some further information as to the work carried on at this Institute. Mr. Latham

Mr. R.
Porter.
3 July, 1907.

Mr. E.
Porter.

3 July, 1907.

raised the point as to the paragraph in your *précis* where you say that "The objects of this school is to prepare young men and women for the work of a farmers' life, by instructing them in the principles which underlie farming operations and demonstrating in the lecture room and on the farm modern and scientific methods of agriculture." How do you prepare students for that?—Take the case of stock. You can describe to students the approved methods of feeding, for example.

13554. That is all indoor work, I presume?—I thought the point was how we prepared young men for the work of a farmer's life.

13555. It strikes me that is preparing him in a theoretical way more than in a practical way?—Take botany, for instance. You might give lecture after lecture on the cell of a plant, for example, which would not be of any great assistance to the student, but you might also select information about the plant itself which would be of great practical value to him.

13556. You do not give any instruction on the land actually on the spot?—The students go down to the County Council Farm once a week. We have a number of what we call educational plots for growing all the different kinds of forage plants. Very few crops, as a matter of fact, are grown in Lancashire, but you have in these plots the plants that are grown in different parts of Great Britain; and the lecture is supplemented by the instruction on those plots. They also go through the farm buildings, and sanitation and so on is discussed.

13557. Is there any other matter that you would like to draw the attention of the Committee to?—I do not know that there is.

13558. (By Professor Middleton.) Do you yourself teach at the Harris Institute?—Yes.

13559. What is your relation to the county farm, are you director of the county farm?—No.

13560. You are, of course, at liberty to take your students there just as much as you like?—Yes, I take them once a week.

13561. With regard to your course of instruction, the normal course is four winters?—Yes.

13562. Are the first two winters mainly preliminary, or do you begin the technical work right away?—The first winter is more or less a school course, with some science introduced.

13563. And the second winter?—That is of a more specialised kind, more agriculture and more botany.

13564. Agriculture begins as early as the second winter?—In the first winter they get some—on soils, chiefly.

13565. Then in the third and fourth?—The third and fourth are designed exactly on the lines of the examination for the National Diploma of Agriculture examination.

13566. Preparatory for the National Diploma examination?—Yes.

13567. Is your four years' course one whole course or can a student come for two years and then leave having got a fairly complete course, or must he go right through the four in order to get the full benefit of the instruction?—Some students who come for, say, the poultry certificate take the first and second years; but those, of course, who wish to be trained for the National Diploma take the whole four.

13568. How many enter your institute each year?—Fresh men?

13569. Yes.—A little over 20—26 is about the average.

13570. At the present time you have 66 in residence?—The total number, yes.

13571. Twenty-six the first year, how many the second?—They gradually go down.

13572. To about 20 in the second?—Something like that.

13573. About 10 in the third?—No, 15 or 16 in the third.

13574. The same in the fourth?—About a dozen in the fourth.

13575. Fifteen will take three years and a dozen four and the remainder a shorter course?—Yes, I may say we have a special agricultural course of two winters for practical men who are unable to take the longer courses.

13576. Do you have anything in the nature of a ten-

weeks' agricultural course?—Not at the agricultural school.

13577. Have you anything less than the 26-weeks' course?—No.

13578. (By Mr. Latham.) Have you any certificate or diploma to grant to the young men who have been with you for four years?—Yes, a diploma. They satisfy certain conditions which are set out in full in our scheme.

13579. Do you think the teaching at your farm on the whole is thoroughly appreciated in the county of Lancashire?—It is being appreciated more than it was.

13580. You are one of the lecturers, are you not?—Yes.

13581. Do you find your lectures have been appreciated or not?—Of course I think so, but, still, that is rather a difficult question for me to answer. I will say this though, that I think the farmers themselves like me to give them a demonstration on the plots better than to give them a lecture. Of course I have given both, but I think the farmers themselves appreciate the demonstration on the plots more than an actual lecture in a room.

13582. Are the demonstrations carried out all over the county?—Yes, they are, I might say.

13583. Farmers are willing to give up certain portions of their farms for you to demonstrate on?—Yes.

13584. Are any records kept of that?—Complete records.

13585. And circulated?—Yes.

13586. I do not quite understand with regard to your cheese school in the farm itself, what is the number of students you get there at a time?—About 12 or 15.

13587. How long do you keep them?—They stay for eight weeks.

13588. Your course of cheese teaching is about eight weeks?—At the dairy school—that refers to the junior courses. There is an advanced course in the summer of 12 weeks' duration, and then another course which goes on for something like 16 weeks in preparation for the National Diploma in Dairying.

13589. This instructor that goes round the county to the several farms is simply a person who goes to people fairly well educated in cheese making to rectify some mistakes they may possibly have made?—You refer now to the migratory cheese instructor?

13590. Yes.—He meets the people at market and other places, and they ask him to visit them because some little thing has gone wrong with their cheese, and he goes down and tries to put it right.

13591. I do not know that he can do very much in five days?—Supposing he gets a person whose knowledge of cheese making is very deficient, he starts them in the work and in some cases stays with them four or five days.

13592. You cannot educate a person in cheese making in four or five days?—The instructor occasionally goes afterwards to see how things are going on.

13593. Do you mean to say you can give complete instruction in cheese making in five days?—Not, of course, complete, but the results are very good indeed.

13594. We have heard that there has been a lot of bad cheese made—I am not alluding to your county itself, mind?—The system has evidently worked well, as the standard of cheese making has undoubtedly been raised very considerably.

13595. I did not think it was possible to give good or complete education in anything in four or five days?—I have said that the instructor occasionally visits the makers after they have been started by him. I might mention that he considers it advisable to leave the makers to themselves for a short time after he has given them the preliminary instruction as he is of the opinion that they master the art more rapidly when they are taught to rely more on their own efforts than on his personal daily assistance.

13596. If he has been to give instruction in cheese making, he periodically goes afterwards, whether he is asked or not, to see whether the thing is going on successfully?—Yes, he does.

13597. Is there a desire on the part of agriculturists generally to get this very little education in the way in which you have described?—Yes, in fact he told me only a few days ago that he could hardly keep pace with the demand for him.

13598. I am not surprised to hear that, because, of

course, a great many of these men that you speak about must have a very small knowledge of cheese making?—They get good prices for their products, and they seem to do the thing wonderfully well.

13599. Then they must be fairly educated before the man goes to them?—A large proportion, of course, have a good knowledge of cheese making, and the new cheese makers are in some cases those who have given up selling milk and who wish to take up cheese making.

13600. Has the dairy teaching in your school and also in the outside districts caused the price of cheese to rise?—There is no doubt about that.

13601. With regard to the remarks of the last witness about the butter, do you think that the teaching of butter making in Lancashire has not raised the price of it, or has not raised the quality of it, and is not appreciated?—The butter making in Lancashire does not seem to be a source from which the farmers get their chief income, and I think on that account, perhaps, they do not take nearly the same interest in butter making as they do in cheese making.

13602. I suppose that applies to almost every county in England at the present time, that butter making is nearly lost through the great neglect of the agricultural interest, and I think, and hope, that has been brought back to a great extent by the dairy schools going the breadth of the land. I know cases where butter has been raised 2d. a lb. owing to the visits of these dairy schools?—The price of cheese is undoubtedly higher as a result of the instruction given, but I am not so certain about the butter.

13603. Can you tell us the price you get for the butter made in the schools?

(*Mr. Hale.*) 1s. 3d. to 1s. 4d.

13604. What about the price of butter in the district generally?

(*Mr. Hale.*) The average price of butter on the Preston market is 1s. to 1s. 6d.

13605. With regard to the scholarships, where does this £900 go to?—I see there is £900 either allocated or given for scholarships?—At the end of each year, examinations are held, and those who attain to the standard required get either exhibitions or scholarships.

13606. Where are they allowed to go?—Suppose a first year's student obtains an exhibition he takes the second year's course in our own school; none of them go away until they pass through the fourth year. The two who get the valuable scholarships go away to some University.

13607. What is the value of the two highest scholarships that go to the University?—£60 usually for three years.

13608. Then all the rest of the scholarships that are won are used in your own school?—It is an additional, I suppose, prize we might call it, for good work done.

13609. If you only give two scholarships I cannot see how you can lay down £900 as being given away for scholarships, because the other is free education?—The two do not constitute the whole of the scholarships that are given.

13610. If I have made a mistake perhaps you will kindly correct me. £900 is given in the book as being expended in scholarships, and I thought I understood you to say that all the scholarships that were given were two scholarships?—The £900 represents the money allocated for scholarships and exhibitions in that year.

13611. Not used?—Yes, used, but only two students each year go outside the county in using the money; the other money remains.

13612. They cannot take money, because the education is free?—It is paid to the students.

13613. Paid to the students who come to your school?—Yes.

13614. You not only give them free education, but you give them so much money to come?—We do.

13615. (*By Mr. Medd.*) You do, as a matter of fact, allow them 10s. a week?—Yes, and I might explain that we distinguish between exhibitions and scholarships. Those who win a scholarship do not get the 10s. a week for maintenance.

13616. (*By Mr. Latham.*) I presume from the reports in this book that you do nothing in the way of research work at all?—Some of the work that is done on the plots is to some extent research work, although most of it is demonstration work.

13617. There is no idea of doing any research work, I suppose?—There has not been any very important research work started so far, but there is a little being done. I might say that a grant of £100 is made to the University of Liverpool for research work on plant diseases.

13618. (*By Professor Middleton.*) By the county?—By the county.

13619. (*By Mr. Medd.*) There is one point here in regard to these finances which I do not understand. Under one head it states that the total expense was £1,066, of which the Lancashire County Council made a grant of £650. The Lancashire County Council made a grant to you of £650?—The County Council made a grant of £650 to the Harris Institute.

13620. I do not make those figures dovetail with these figures here. At present, I must confess, the methods in which the funds are raised and expended creates some little confusion. It is probably the fault of a mistake here. Do you take lady students?—Yes.

13621. We have been under the impression, I may say, throughout the examination that you only took males. I think most of the Committee based their questions upon the supposition that the Institution was for males and not for both males and females. In regard to the housing of the females, do you make any difference from that of the males?—You are referring now to the agricultural school?

13622. Yes.—The students reside in approved lodgings in the town.

13623. That applies to males and females?—Yes.

13624. Do you think that four short courses during the winter are equal in value to two whole years?—What do you mean by two whole years?

13625. Constant attendance.—I do not know of an institution where there is such constant attendance.

13626. Yes, at Reading and at the Harper-Adams College there is. They have the usual college holidays, of course, but for the rest of the year their students attend?—Most institutions do not give more than 30 weeks in the year, do they?

13627. I am told 30 to 36 is the usual course. What is yours?—Twenty-six.

13628. You think the character of the work that can be done during the summer can be done equally well in connection with such an institution as yours as it could be at a place of higher education?—I am not quite aware what the intention of the Committee was when the scheme was first arranged, but at present it allows of the students going back to the farms while the busy times are on and of coming to us in the winter.

13629. In looking at the curriculum of your Institution, and its terms, I think you make it too cheap. I believe if you were to charge fees you would raise the place in estimation, and you would most probably get, I will not say more, but a better class of student. It is a great deal to offer anyone free tuition and an extra 10s. a week as well, and when you do that you do rather lower the appreciation in which an institution is likely to be held. I do not know whether you would be prepared to agree with me there. That is a remark I often make to Sir John Hibbert when talking over the Institute. You see my point—that you may be going too low, and people value a little more what they pay for than what is given so very freely and with 10s. in addition. Give them free tuition, and let them provide for their own keep—of course, that is only my own opinion. I notice you do nothing for the training of elementary school teachers?—Some classes in nature study were held on Saturdays about three years ago.

13630. They would probably come on a certain number of Saturdays, or every Saturday in the year?—That was done under the Agricultural Committee.

13631. Why was it discontinued?—I cannot say.

13632. Would you, speaking for the Institute, have any objection to making provision for those teachers. It is a normal feature at every agricultural college?—I might say the Education Committee is considering the instruction of school teachers in horticultural matters with a view of teaching gardening at the elementary schools.

13633. That is what I mean. Of course, one roughly speaks of agriculture, but what I mean is the training of teachers in subjects that more appropriately belong to horticulture, so that they may teach horticultural subjects in elementary day schools?—That is being considered—in fact it has practically been passed.

*Mr. E.
Porter.*

3 July, 1907.

Mr. E.
Porter.

3 July, 1907.

13634. I am glad to hear it because it is an essential, especially where an area is so urban as Lancashire. It is more needed than anywhere to develop the intelligence and observation of these children by work outside their ordinary daily life. Has your committee considered at all the practicability of combining, as I mentioned to the last witness, Lancashire, Cheshire, and Derbyshire?—I do not think so.

13635. We want to get a collegiate, or university centre, in each section of the country, and then a school of lower grade, and an intermediate agricultural school. You would have the advantage of two, Holmes Chapel and of the Harris Institute, leading up to an agricultural training and spirit in the whole of the different districts. I suppose it has never been formally considered?—Not before the committee.

13636. It is a subject that is worthy of consideration, because you see down where I am, down in Gloucestershire, and where you are in Lancashire and Cheshire, it is all white, all blank, and the rest of the counties have combined for purposes of agricultural education and mutual education, because they have co-operated, and one county may provide one school of one type and another of another, and there is no necessity for each of you to be providing the same. Do you follow?—Yes.

13637. I mean you do not want the agricultural college in every county because it cannot be supported. I will not ask you any questions about it because you have not thought of it, have you?—No, I have not thought of it from that point of view.

13638. Could the Harris Institute as a whole be converted into a practical school of agriculture?—As a whole?

13639. As a whole.—Of course, the Harris Institute teaches many other subjects than agriculture.

13640. Why I ask is because the last witness said in reference to this sub-division of counties, "we have already Holmes Chapel accessible," or why should they choose Holmes Chapel. Holmes Chapel is an agricultural school. From your reply I suppose the Harris Institute could not be converted into an agricultural school?—I think if I remember rightly you said something about the Manchester University.

13641. Yes, and then I said the two, and then he said: "And there is Holmes Chapel"?—Is it your idea to have a university department of agriculture, and also schools leading up to it?

13642. Yes—in your elementary schools and continuation schools you should, as far as possible, teach subjects bearing on agricultural matters, and do it for educational reasons. I do not care whether they become farmers afterwards, or whether they become statesmen. It is to open their eyes, and make them intelligent, in other words, for purely educational objects, as I say to further their powers of observation. Then I go a step higher to the continuation school, that is for the people who wish to study agriculture technically in its simplest branches, just as a lad wishes to know how to handle a saw, and to make a hurdle, and that kind of thing?—Do you mean the ordinary grammar school when you say continuation school?

13643. No, the ordinary continuation school. Then the school above that is the practical school of agriculture. Yours is really rather less than Holmes Chapel, but they both run *pari passu*—I am not questioning the effect of yours, but that is the grade that comes next after the continuation school?—Yes, I follow.

13644. Then the best pupils from each of those schools go to such an institution as the Agricultural Department at Manchester University. Those are men who are not studying so much for the purpose of farming as to become teachers, and to become mainly scientific researchers, and to acquire at that university a degree in agriculture

superior I should say to the one offered in London and equal to the one offered at Cambridge. That can only be properly carried out by two or three counties combining, so that the particular grade of education wanted by each must be supplied jointly. We cannot have them all go to the expense. You and Cheshire have combined in so many things that it should not be very difficult to effect further combination between you?—Yes.

13645. That is my idea, and if you would try and think it out—of course, it is only a rough idea, but that is what one wants to see—and when you have an opportunity of meeting other people connected with education you might kindly consider how it might be done. In Lancashire you are partly connected with Liverpool and partly connected with Manchester?—That is so.

13646. You are not identifying yourself with Manchester solely: you partly go to Liverpool. You will think that sort of idea over?—I will.

13647. (By Lord Barnard.) Mr. Latham and I would like to know whether you have now, either at the Harris Institute or going through your dairy courses, any students who do not belong to the county?—We have a few each year.

13648. Would you tell us whether they pay fees?—They do.

13649. Can you tell us what the fees are in each case?—At the agricultural school a composition fee of 10 guineas per session, per winter, that is, is charged; at the dairy school the fees are given on page 10 of this scheme (*handing document*.)

13650. Do you manage the finance of the agricultural department?—There are special men to deal with the finance. I do not personally deal with it except the sum totals. I just notice what is being done.

13651. I did not know whether you prepare any balance sheets or any accounts?—The balance sheet has been given in.

13652. Do you prepare it?—No.

13653. You have nothing to do with the finance?—I am supposed to know how the thing is.

13654. Are you responsible for it in any way?—No.

13655. Who keeps the accounts for you—a clerk?—Yes.

13656. There is one more point in connection with the finance. Mr. Brooke-Hunt tells us in his report here that at the Institute for the last complete year £46 were received in fees for analyses?—Yes, fees for analytical work go to the Harris Institute, not to the County Council.

13657. That is not the point which I want exactly to ascertain. What analytical work do you do. Is this the work under the Fertilisers and Feeding Stuffs Act? Is it statutory work?—In many cases the farmers send the manures directly to the Harris Institute.

13658. There are two ways of doing this as perhaps you know. One is by a formal procedure: under the Act of Parliament the duty is deputed to the County Council, and the other is an informal way in which it is done very often, sometimes by a private individual off his own bat, and sometimes through the intervention of local chambers of agriculture, and so on. Is this official work under the Act, or is it outside the Act?—Very largely outside the Act.

13659. (By Mr. Latham.) Are you actually putting the Act in force as the instrument of the County Council, or are you simply doing it as an individual directly for the farmers.

(By Mr. Brockholes.) The Act is put in force by the County Council, acting through the Diseases of Animals Committee. The Agricultural Sub-Committee is a Sub-Committee of the Education Committee.

TWENTY-SIXTH DAY.

Thursday, 4th July, 1907.

PRESENT :

The Lord BARNARD (*in the Chair*).

Lord MORETON.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor W. SOMERVILLE, D.Sc.

Mr. DAVID DAVIES, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. W. FITZHERBERT BROCKHOLES (*Chairman of the Lancashire Farmers' Association*), called and examined.

13660. (*By Lord Barnard.*) You are a Member of the Lancashire County Council?—Yes.

13661. And a member of the Agricultural Sub-Committee of that Council?—Yes; I joined that Sub-Committee four years ago.

13662. I understand you are here principally as a representative of various agricultural associations in Lancashire?—I represent the Lancashire Farmers' Association; we have 21 branches, and about 1,400 Members, and embrace a large area of the county.

13663. You yourself farm?—Yes, I do. When I left school I went to live on a farm, and I farmed over 600 acres as a tenant farmer before coming into my present estate.

13664. And you have long been closely associated with farmers?—Yes.

13665. You heard the evidence given yesterday, and I understand you would like to give this Committee your own opinion upon certain points?—I had not intended to offer evidence from the point of view of the Agricultural Sub-Committee, but as it seemed from some of the questions put to Mr. Hale and Mr. Porter that one or two misunderstandings exist, I think I had better first endeavour to remove them. The position of the Harris Institute does not appear to be understood. It is not by any means a purely agricultural institution.

13665a Briefly, its history is as follows: A good many years ago a Mr. Harris left some £250,000 to trustees to spend according to their discretion for the benefit of Preston and neighbourhood. The greater part was spent on a free library and technical schools, these latter embracing art schools, technical schools for cotton industry, building trades, engineering, teaching languages, evening classes, &c. Some years after came the days of the "whisky money," and the County Council then joined hands with the Harris Institute for agricultural teaching as far as the holding of classes was concerned.

13665b Shortly afterwards the County Council took the Hutton Farm and started developing their existing system of agricultural education, all of which, except the classes held at the Harris Institute, is independent of the arrangements with the Harris Institute. The Hutton Farm is about four miles from Preston, and it is there that the dairy and poultry classes are held. The students attending the classes at the Harris Institute in Preston have to make their own arrangements about lodging in approved lodgings. The students attending the dairy classes at Hutton are housed in what may be termed hostel arrangements at and near the farm itself. I thought it desirable to explain in this way the nature and position of the Harris Institute.

13666. The position is a little complicated?—Yes.

13667. Perhaps you would now like to give the Committee your opinion of the agricultural work done in connection with the Institute?—I think the results of the teaching, as gauged by the examinations, have undoubtedly been very good.

13668. You think that the agricultural industry is deriving some practical benefit from the Harris endowment?—Yes. The County Council makes a money contribution towards the institution, as explained in page 68 of the Board of Agriculture's Annual Report for last year. The County Council makes a grant of £650 towards the Harris Institute lectures, and they get the benefit of using the class-rooms and also certain teaching in chemistry, botany, and other subjects. It is really a joint arrangement.

13669. As I understand, you get certain advantages from their scientific teachers?—Yes.

13669a. Probably you also get the use of the rooms?—Yes.

13670. May we say, that if this Harris endowment did not exist, the cost to the County would be greater than the £650?—Yes; we should have to put up something on the lines of a college building, &c.

13671. Yours is not the only case in which such instruction as you give is assisted to a certain extent by what is technically called charity money or public endowment?—The financial arrangements are explained at the bottom of page 68 of the Department's Annual Report.

13672. Perhaps the total mentioned there does not include such extra services as the use of the rooms and buildings and the laboratories or help from other teachers?—Perhaps not; there is a sort of general give and take.

13673. I have a return here of the number of candidates who passed and failed in the National Diploma Examination, and I think it is right the Committee should know that the Harris Institute appears to have done remarkably well?—It has; I think it has come out at the top of the tree in that list.

13674. You send up more candidates than most other institutions and get a considerable number passed?—Yes. I should like to call attention to page 16 of the County Scheme of Agricultural Education, which was handed in by Mr. Hale, and which fully explains the courses given, the length of time occupied by them and the time available for the students to go and work at their own farms. Pages 23, 24 and 25 explains the whole system of scholarships and exhibitions.

13675. You also give in that book particulars of the certificates and diplomas?—Yes. I should also like to hand in the monthly report of the Agricultural Sub-Committee for June as furnishing an idea of the routine work carried out. That shows the work of the cheese instructor and the migratory dairy class. A copy of that Report can be sent to each Member of the Committee.

13676. How often do your Committee meet?—Once a month.

13677. Do you report to the County Council?—Yes, there is a monthly report to the Higher Education

Mr. W. F.
Brockholes.

4 July, 1907.

Mr. W. F.
Brockholes.

4 July, 1907.

Sub-Committee, and that goes on through them to the full Education Committee of the Council.

13678. Is there usually much discussion on the subject in the County Council?—Very seldom. The quarterly meetings of the Council are practically for confirmation of the reports of the Committees. Anything connected with agriculture goes before the Agricultural Sub-Committee, which reports to the Higher Education Sub-Committee, and then through them to the Education Committee. The Education Committee has to report to the County Council, which, however, can only criticise and not reject.

13679. What is the feeling of the principal local authority in your County on the subject?—Matters are well thrashed out by the Agricultural Sub-Committee. Some point may arise for subsequent criticism, but, as a rule, matters pass through after being properly sifted, and the Council as a whole appears to have confidence in the work of the Agricultural Sub-Committee.

13680. Is there any danger of a reduction in the efforts now being made?—Oh, no, certainly not. The County Council are doing their best to improve and develop all educational work, and I think there is no danger of their efforts being relaxed. Recently the Agricultural Sub-Committee have gone into the question of school gardens, and two of their number paid a visit to Staffordshire. The result was a recommendation to the County Council to make a start in that matter. That recommendation was adopted by the Education Committee at their last meeting, and a start is being made more or less on the lines that have been adopted in Staffordshire.

13681. In view of this Committee's enquiry I understand you were good enough to draft and forward to various farmers in your County a letter asking for replies to certain questions?—Yes.

13682. You have handed in a copy of that letter?—Yes.

13683. I understand you would now like to summarise and comment upon the answers received?—Yes; the replies to my questions vary somewhat, but on one point there is practical unanimity, viz., as regards the success of the peripatetic cheesemaking instructor, who visits cheesemaking farmers at their own farms and gives practical advice and instruction on the spot, taking into consideration the particular conditions and circumstances in each case. I may say that the cheese instructor is a practical farmer and cheese-maker, and the instruction he gives is not designed to produce any radical alteration in the general methods of making Lancashire cheese, but is rather directed towards carrying out the process of making that particular type of cheese in the best possible manner. The effect is to level up inferior makers to the standard attained by the best makers. That effect has undoubtedly been achieved, as gauged by the better qualities of cheese exhibited in shows, the price obtained in the markets and the expressed opinion of dealers, consumers, &c.

13684. I suppose one object is the economical production of cheese?—Yes; to make the best of the farmers' own surroundings and capabilities.

13685. That effort has been successful?—Most successful. The farmers in response to enquiries have unanimously testified to the benefits derived. Some of the replies to my letter have contained suggestions that this method of instruction might be usefully employed in the case of other departments more than has been done hitherto.

13686. Do you think that is practicable?—Yes, I do. Poultry keeping has been specially mentioned as lending itself to the services of a peripatetic teacher giving practical advice to poultry keepers at their own homes. I have not gathered that this suggestion has been made as an alternative to the method of giving instruction in poultry keeping by means of lectures, but as supplemental to the giving of lectures. There is ample evidence that the lectures in poultry keeping have been productive of very great good in Lancashire, and are well appreciated.

13687. Is it considered that these lessons have made poultry keeping more profitable?—Yes, through the advice given to them the farmers have been able to get a better production of eggs, and the breed of poultry has been improved. Moreover, some have learnt how to dress fowls properly for the market, and so get a better price for them. I have no hesitation in saying that advice and instruction in any branch of farming given directly on the spot by a practical person who personally understands the farmers' own views (and

possibly prejudices) and who is able to judge of the particular conditions and circumstances in each case, undoubtedly appeal more directly to farmers, as a class, than any other method of instruction. Farmers all round seem to appreciate these personal visits.

13688. You think that the more that system is extended the greater will be the confidence of the farmers in it, and the greater the advantage to them?—Yes. As a Member of the Agricultural Sub-Committee, I know that this fact is recognised, and that the various lecturers and dairy instructors do what they can in the way of visiting farms when giving courses of instruction in the different districts, but it is evident that the more that can be done in the way of personal visits and advice on the spot, the more readily will the ordinary farmer open his mind to derive benefit from the application of scientific knowledge to practical experience.

13689. That may, and probably would, mean the expenditure of more money?—I am not sure if it would necessarily do so. I have not gone into that, but anyhow I think the more work that can be done in that direction the better.

13690. The necessary consequence would be increased cost?—That might be so. With regard to the actual benefits derived from lectures, opinions vary a good deal. Much, if not everything, depends upon the lecturer being a practical person and speaking to his or her audience in terms that can be easily understood.

13691. That confirms a great deal of evidence we have already had?—A lecturer may embrace, say, a dozen points in his lecture and make 11 of them clear and telling, but if through want of practical experience he rather gives himself away on the twelfth point, his audience will be sure to remember this latter and comment freely on it to the disparagement of the whole lecture, and will either discredit or forget the other 11 points.

13692. Do you find any difficulty in filling up vacancies on your staff?—Yes, sometimes there are difficulties.

13693. No doubt candidates are numerous, but is it your experience that really good candidates are not always easy to find?—The difficulty is to get practical men with scientific knowledge. One of the greatest difficulties that educational authorities encounter is to find teachers who possess this necessary combination of practical experience, which can only be gained on a farm, with scientific knowledge and capacity for imparting it to others, which can only be gained by a course of study and training.

13694. As the system is really only as yet in its infancy is it not probable that in the course of time the supply of competent teachers will increase so as to meet the demand to a great extent?—Yes, we hope so. We hope to see more teachers recruited from the practical farmers. I might mention that our Secretary of Agriculture is a son of a Lancashire tenant farmer, and was the winner of a Lancashire scholarship.

13695. Are you a member of the Sub-Committee who make the appointments?—Yes, I am on the Agricultural Sub-Committee.

13696. You take trouble to find out whether applicants have had practical experience?—Yes, we do our best in that respect, but that is sometimes a difficulty. We have now got what we believe to be a good horticultural instructor, who is developing peripatetic work in that department.

13697. Don't you think that the practice obtains pretty generally of preferring teachers who have had practical experience?—Yes, I cannot imagine any practical Committee not taking that line.

13698. Will you now tell us what are your opinions with regard to the farm at Hutton?—As regards the benefits derived from the County Council farm at Hutton, opinions are still more varied. This farm has many rôles to fill, such as to provide facilities for teaching courses in every branch of dairy work and courses of poultry keeping, to carry out practical and experimental work for the benefit of Lancashire farmers in general and for the agricultural students at the Harris Institute classes in particular. The Hutton farm is managed by four or five members of the Agricultural Sub-Committee.

13699. Now what about the dairy classes?—The dairy classes at Hutton Farm seem to meet with general approval and have, without doubt, been the means of effecting great improvements in the dairy industries throughout Lancashire. With regard to that industry I should put first in importance the fresh milk trade,

then the manufacture of cheese, and butter as the least important of these three branches of the dairy industry as far as Lancashire farmers are concerned.

13700. Is there not an enormous amount of butter consumed in your county?—Yes, but there is keen competition from Keil and foreign butters and from adulterated butter, too. Inferior and adulterated butters seriously affect the price of good butter.

13701. Is the milk trade increasing?—It increased enormously up to about three years ago, and during the last two or three years it may have increased a little, but, I think, it is now more stationary.

13702. Are your local authorities stringent in their requirements as to the places from which milk comes?—They vary a good deal. Some are less reasonable than others in their requirements.

13703. Do you think the condition of the byres in the county has improved?—Yes, I rather think so, speaking generally.

13704. Is the work done at Hutton appreciated?—The practical and experimental farm work at Hutton does not strike home to Lancashire farmers as a class. There are certain obvious reasons for this; such as the size of the county and the expense and difficulty in visiting the farm; the great variety of soils and farming conditions in the county, many of which differ materially from the soil and other conditions at Hutton.

13705. What experimental work is carried on at the farm—is it research work or demonstration?—Mainly demonstration work. There is some research work in the way of experiments as to cattle feeding and trying the effect of different kinds of manure, but there is no analytical research work on the farm. There is a laboratory at the Harris Institute, but that is Harris Institute business.

13706. Do farmers visit the farm?—Yes. A certain number do, but Lancashire is a widely scattered county and they usually come from a limited radius. Groups of farmers are encouraged to visit upon certain days.

13707. Does the number of visitors increase?—Mr. Porter informs me that the number of visitors remains much the same year by year.

13708. We have been told of other cases where even one visit to such a farm has opened the eyes of farmers as to work which they had not previously understood, and the result has been that visiting farmers have not only come again, but have brought their friends with them?—I could only state my own impressions as to that. From the replies that I have received, it is evident that there is a great wish for educational and experimental agricultural work of all kinds (including horticulture) to be carried out at as many centres as may be practicable. The Agricultural Committee have recognised this, and have been taking steps for some time past in this direction, and the more they can develop this method of conveying information and instruction, the more effective will be their efforts to benefit the farming class as a whole. Our policy has been to reduce the experimental work at Hutton Farm, and to take parts of fields or whole fields in different parts of the County for carrying on certain experiments.

13709. Your experience leads you to consider that a better plan than doing all the experimental work at a central farm?—Yes.

13709A. Are your experiments all made under one Director?—Yes, under Mr. Porter.

13710. They are all controlled by one brain?—Yes; he frames his scheme and submits it to the Committee, and after it is approved, he is responsible for carrying it out.

13710A. So that there is no duplication, and the various circumstances of different districts are duly considered in tabulating the results?—Yes, the results are published from time to time.

13711. Do they reach the farmers' hands?—Every effort is made with that view. They are circulated. The local newspapers publish them, and they are sent round in the form of pamphlets.

13712. In connection with that subject, do you think that the Board of Agriculture leaflets circulate freely in your County?—I think so; we do our best to circulate them, through the Lancashire Farmers' Association, with our 1,400 members. We supply a list of all our farmer members and the leaflets are sent to them.

13713. It always occurs to me as a difficult question in the case of an agricultural population, who live some

distance from one another, to get printed intelligence into every home?—I think the local newspapers do good work in helping us in Lancashire. The more important leaflets published by the Board of Agriculture are reprinted in full in the local papers. One local paper which has a large agricultural circulation always gives a whole page and often more to agricultural matters.

13714. To go back for one moment, do you think it feasible, and, if feasible, would it likely be successful and useful to have all the experimental work done in the county under the ken and guidance, although not under the control, of a central authority in London, so that the results of what is done in one county might be available over the whole of England?—I should think that would be an excellent thing. I understand you to mean that the local results should be furnished to a central authority which might tabulate them, summarise them, publish them, and draw conclusions from them.

13715. Yes; comparing them with similar experiments, perhaps in different soil, climate, aspect, &c., at other places?—I should think that would be most useful.

13716. You would not yourselves have any objection to such Government inspection and guidance?—Personally, I cannot conceive any objection.

13717. You have something to say with reference to the replies to your third question?—Yes; that question was an enquiry whether the agricultural classes and teaching would be increased in value if those engaged in that work were better equipped by more attention having been given to agricultural subjects in elementary schools, and if the teachers in elementary schools in rural districts were better trained in a knowledge of agricultural subjects. I have had some interesting and practical replies to that question. There seems to be a pretty general opinion that the education given in elementary schools is framed too much on town and city lines. It is a fact recognised by everybody that the elementary school syllabus is already full to over-flowing, and that it is not possible to add other subjects, but suggestions have been made to me that much more could be done than is commonly the case in rural schools in the way of imparting rudimentary knowledge of soils, manures, feeding stuffs, &c., and their essential ingredients, making use in giving arithmetic lessons of sums such as would be of practical use afterwards in a farming career, using Readers containing useful information on farming and rural matters generally, &c. Methods of this kind would not entail any addition to the work of a child at an elementary school, and would undoubtedly not only prove of positive utility in after life but would also enable the child subsequently to profit more from agricultural lectures, or other sources of information. Though the point hardly comes within the reference of the Committee, I feel bound to voice some opinions that something might be done with advantage in the direction of obliging or inducing teachers in elementary schools in rural districts to acquire more knowledge and take more interest in agricultural and rural matters. Some teachers leave nothing to be desired in this respect, but it is not so in a great many cases.

13718. This Committee is only a Departmental Committee appointed by the Board of Agriculture, and not a Royal Commission. We have to deal with the provision now existing, but incidentally many of our witnesses have taken the same line as yourself. The question you raise is one that can only be dealt with by the Board of Education, but would you suggest that this Committee should urge the President of the Board of Agriculture to represent the point to the Board of Education?—I should certainly desire to do so.

13719. Do you think, for the sake of the subject into which we are enquiring, that it is absolutely necessary that the point should be pressed home?—Undoubtedly.

13720. That is your opinion?—Certainly. It may be outside your Committee, but at the same time there is the evidence that has come to hand, and I think it is only right to make it public in some way.

13721. What you wish us to explain to the President of the Board of Agriculture is, that unless there is something done in this direction the present instruction will not be sufficient?—It certainly will not.

13722. One word with regard to these teachers. I do not think you can, strictly speaking, divide elementary school teachers into rural and urban?—No, you cannot make a hard and fast distinction.

13723. Another point that has been made before us is, that the curriculum in the training of elementary school

Mr. W. F.
Brockholes.
—
4 July, 1907.
—

Mr. W. F.
Brockholes.

4 July, 1907.

teachers is already so overcrowded that it would be very difficult to press them to take up other subjects?—That may be the case, but I think if a teacher is going to teach in an elementary school in a rural district that there might possibly be one or two other subjects dropped.

13724. That we have been told by other witnesses too?—I think no doubt there are some things in the curriculum that might be omitted.

13725. If some teachers possessed these qualifications the managers of schools which essentially needed such teachers would naturally select one that had those qualifications in preference to one that had not?—Yes, I think there ought to be something to encourage that type of teacher in elementary schools in rural districts. Then with respect to the agricultural education provided by means of the Harris Institute classes, the benefits offered are of two kinds, viz.:—direct to the individuals attending the classes, and indirect to farmers as a whole through the students. The success of the Harris Institute students in competitive examinations and in their after careers is ample proof of the direct benefits they have derived individually, and can be easily gauged, but it is much more difficult, if not impossible, to gauge the benefit of the agricultural instruction at the Harris Institute to the farming class in Lancashire as a whole.

13726. However impossible to gauge it, you are perfectly satisfied that it exists?—There is no question that it exists. I should like to hand in a return which was alluded to yesterday and was left alone as it was coming in my evidence.

13727. If you please.—About two years ago a return of the then present occupation of all the past students of the County Council Agricultural School was compiled from replies from all those who could be reached; 159 replies were received and showed the following results:—

Number actually engaged			
in arable or dairy farming ...	85		
„ in occupations immediately connected with agriculture ...	18		
	103, equal to 65·2 %		
„ employed as teachers of agriculture or dairying ...	22	„	13·8
„ of students then at agricultural universities or colleges ...	7	„	4·4
„ in occupations not immediately connected with agriculture	24	„	15·1
„ dead or out of employment...	3	„	1·5
Totals ...	159	„	100·0 %

The number of 85 out of a total of 159 who have joined the ranks of working farmers does not appear very satisfactory from the point of view of raising the standard of farming knowledge in Lancashire, and also when taking the large farming population of Lancashire into consideration, especially when it is remembered that almost all the 29 who took to the teaching profession are engaged elsewhere than in Lancashire.

On the other hand, it is only reasonable to suppose that successful students will pass on some of the scientific knowledge they may have gained to relations and friends engaged in farming, and will also have stimulated these latter to make efforts to acquire further information and knowledge. I cannot see how you can possibly gauge it; but there is no doubt that a considerable amount of good has permeated all through the farming classes by the work that has been done.

13728. I see there are very few large farms in Lancashire?—That is so; there are plenty of small holdings in Lancashire.

13729. Out of just under 20,000 holdings there were only 83 above 300 acres?—Yes.

13729A. 11,000, which is more than one-half, are from 5 to 50 acres?—Yes.

13730. The average size given in the Board of Agriculture returns of all the holdings in the county is 40 acres, and that is very small?—Yes.

13731. Have you anything further to say as to the

Harris Institute?—An institution like the Agricultural School at the Harris Institute is really catering for two classes, viz.:—those who wish to become teachers, and those who merely wish to learn a reasonable amount of scientific knowledge to apply to practical experience so to produce the best financial results in their own interests. How to cater for the first of these two classes without exceeding the requirements of the ordinary farmer seems difficult, if not impossible; and I will leave it to others who are actually struggling with this problem to express opinions and suggest solutions.

13732. At any rate over 50 per cent. of the students whom you train are persons who wish to learn a reasonable amount of scientific knowledge to apply to practical experience?—Yes.

13733. A good many others in an indirect way bring the benefits of that training to bear on practical farmers as teachers or as agents, or in some way or another?—Yes, in some way or another indirectly. With regard to our agricultural classes, it came out in the evidence yesterday of Mr. Hale and Mr. Porter that the full course spreads over four years of winter sessions; but there is an arrangement which Mr. Porter could explain in detail if you would like to hear it whereby a two years' course can be utilised for those that cannot spare the time or do not wish to go in for the full course.

13734. With your great knowledge and experience on the subject can you tell me whether you are satisfied with the present conditions. You have already told me one direction in which the work could be extended, that is in the case of more visits being paid to farms; and I should like to know whether on the whole you are satisfied with present arrangements, or whether you have further suggestions for improvements or developments that you wish to offer to the Committee?—There are one or two things I would like to call attention to.

13735. We do not want to go too much into local circumstances, but are there any general principles which you think this Committee ought to keep in view in making its report?—I think the work that is done by this combination between the County Council and the Harris Institute is undoubtedly a very good work.

13736. You think a county is a good unit to begin with?—There are agricultural institutions of different types. If you want an agricultural institution of the type of an agricultural college like the Yorkshire College, the county would not be a large enough unit I think. It is quite large enough a unit for certain purposes, but not for a fully equipped agricultural college with laboratories and all the necessary staff.

13737. You know Manchester University contemplate doing some research work?—Yes; and Liverpool also. The County Council gives grants to both Manchester and Liverpool, and also a special grant not exceeding £150 a year to Liverpool for certain purposes.

13738. We have had some evidence from Manchester as to what they propose. I do not know whether you have heard of that?—No; but they are both similar institutions. I do not know whether you would like to know what proportion of the working farmer class come to these agricultural classes. Mr. Porter informs me it is a little over 50 per cent. of the students that come to the Harris Institute classes. Of course nearly all the dairy ones would be from the farming class—not quite all.

13739. We must bear in mind that you have in Lancashire an enormous population not engaged in agriculture?—We have; but, on the other hand, we have a very much larger agricultural population than the public generally give us credit for.

13740. I see in 1901 you had the largest agricultural population of any county in England except Derbyshire and Kent. They had 44,000 males over ten years of age, and you had 40,500?—Yes.

13741. (By Lord Moreton.) I see on page 23 of your scheme conditions are laid down for the agricultural scholarships?—Yes.

13742. On turning over to page 25 I see it is stated in Clause 4—“The Agricultural Scholarships will be awarded on the character of the work done by the candidates during the Session 1907-1908, together with the results of the examinations held by the National Agricultural Examination Board for the National Diploma in Agriculture.” The question I wanted to ask on that was: does that mean that all the pupils who hope to gain scholarships have to go through the National

Diploma examination?—Mr. Porter tells me it practically means that.

13743. It seems to me very definitely laid down here according to the language of the paragraph; however, we will take it that practically it is so?—Yes.

13744. The National Diploma Examination nobody can very well hope to pass unless they have a very considerable education in agricultural matters?—It is a very stiff examination.

13745. Am I right in supposing you give your scholarship rather at the end of the education than at the beginning?—Would you like to put those questions to Mr. Porter? I think that would be best, because he is the Secretary of Agriculture and more at home in such details.

13746. Very well.—I had not come up prepared to give evidence on these points.

13747. (To Mr. Porter.) On page 25 of your County Scheme, in Clause 5, there is a statement made about the conditions under which agricultural scholarships will be awarded?—(Mr. Porter.) Yes.

13748. That statement practically—I adopt the expression—is that the National Diploma Examination is taken for the test. Is that so?—(Mr. Porter.) The County Council appoint examiners of the agricultural students at the Harris Institute, and their results in conjunction with the results of the National Diploma in Agriculture are used.

13749. In conjunction; but can a Lancashire boy who has been in the Harris Institute get a scholarship unless he satisfactorily passes the examination of the National Diploma Board?—(Mr. Porter.) The students invariably pass through the National Diploma at Leeds as well as our own examination.

13750. You do not say that is a *sine qua non*?—(Mr. Porter.) Yes, I may say that it has been so, except in the case of one student in 1906 who failed to pass Part I. but was, nevertheless, awarded a junior scholarship.

13751. Your scholarships are given at the end of a considerable period of agricultural education work?—(Mr. Porter.) Yes.

13752. Instead of giving your scholarships as many more public bodies do at the very beginning to enable a boy to carry on his education, it seems to me you give it possibly as a reward at the end?—(Mr. Porter.) I might explain that our third year students go in for the first part of the National Diploma and four scholarships are given to those students which will enable them to take the course of the fourth winter session at the Harris Institute.

13753. Do I take it then that supposing a boy from your Institute passes Part I. in the National Diploma satisfactorily that that will entitle him to a scholarship, or do you make him wait until he has passed Part II. also?—(Mr. Porter.) He would have a scholarship after passing Part I., but only four scholarships are offered—not all the students, only the four best ones get them.

13754. When your student has succeeded in getting a scholarship after your course what does he do then?—(Mr. Porter.) Those who get the junior scholarships after passing Part I. of the National Diploma usually stay with us for the second part; those who get the senior scholarships after passing Part II., usually go to Edinburgh, Glasgow or Yorkshire, or some other University centre.

13755. Then I may take it that these scholarships to which we have been referring are more especially for the man who intends to go in possibly for the career of a teacher or a scientist than one who intends to try and get what living he can off the land?—(Mr. Porter.) Yes.

13756. (To Mr. Brockholes.) Do you consider that the farm at Hutton is well equipped as regards buildings?—Yes, it was a home farm and the buildings are good.

13757. The Chairman asked you what your opinion was just now about the Board of Agriculture leaflets and how they could be disseminated. Has it ever occurred to you that the Correspondents of the Board of Agriculture in the different counties could be utilised a little more than they are for that sort of work?—I am a local correspondent, and I think it is quite open to us to be well utilised in that way; but it all depends

on the local correspondent and whether he is willing to exert himself.

13758. Do you find that your neighbours recognise you as such and come to you for information?—I think so. We have one local correspondent a farmer in the Lancaster district and he has taken much interest in this question of abortion of cattle for instance, and he is doing very good work.

13759. (By Dr. Somerville.) Does Lancashire still carry on the practice that it initiated in the early years of the technical education movement of giving a so-called Junior Scholarship to any young agriculturist in the County to enable him to come to the Harris Institute for instruction?—Studentships are given to approved students which entitle the holders to free tuition at the Agricultural School.

13760. Is it not more than that? Do they not get 10s. a week to pay their expenses?—Yes.

13761. Is that continued?—Yes.

13762. So that it is really a scholarship of the value of something like £13 a year?—Yes, the course is 26 weeks in the year.

13763. So that although you may not call them scholarships they are essentially in the nature of scholarships?—Studentships, they are called. You will see them on page 20. "The Lancashire Education Committee is prepared to allow a sum not exceeding ten shillings a week to each student approved by the Committee who attends a full course of agricultural instruction sanctioned by the Agricultural Sub-Committee at the County Council Agricultural School." And on the same page you will find this: "Students must in all cases make application to enter the classes on the form set out on page 40." He applies for permission, he undertakes to attend the classes, he intends to board and lodge at Preston, and so on. That is his own undertaking. They must make application on that form, and no claim for an allowance will be entertained which has not been approved by the Agricultural Sub-Committee. So that there is practically a power of selection. Anybody may apply, but there is a controlling power of selection kept in the hands of the Agricultural Sub-Committee.

13764. May I ask you what test you bring to bear in making your selection?—There is a small Sub-Committee. I am not on that Sub-Committee, but Mr. Porter can give you that information. (Mr. Porter.) Each student has to fill in a form of application and a report is required from the head teacher of the school which the student last attended, and a certificate as to character is also necessary.

13765. So you impose tests of educational efficiency and character?—(Mr. Porter.) Yes.

13766. Do you impose the test also of the profession of the parent of the boy or of his intentions to take up farming after he has had this education? Do you in point of fact give these scholarships to boys whether they are the sons of agriculturists or not?—(Mr. Porter.) They are not necessarily agriculturists.

13767. You do not limit them to the children of agricultural parents?—(Mr. Porter.) No.

13768. You do not, I suppose, try to impose a condition on the youth receiving this support that he shall practise the profession of agriculture afterwards?—(Mr. Porter.) It is assumed that each student is engaged or preparing to engage in agricultural pursuits.

13769. What I wish to ascertain is whether the Lancashire County Council still maintain the policy that it initiated in the early years of the education movement of giving a maintenance grant to any youth in the County of Lancashire that will enable him to come to your central classes for the purpose of obtaining agricultural education?—(Mr. Porter.) Students from the administrative county only are able to get the maintenance allowance, and one of the conditions under which these studentships and scholarships are awarded is that candidates must be persons engaged or preparing to engage in agricultural pursuits.

13770. (By Mr. Latham.) In sending out your letter inviting replies to the questions you have set out here on this paper I notice No. 2 is rather well defined, but I can find no answer to it?—(Mr. Brockholes.) I think the answer to that is the general expression of opinion that the more that can be done in the way of peripatetic instructors, persons going about among farmers, and also

Mr. W. F.
Brockholes.

4 July, 1907.

[Mr. W. F.
Brookholes.

4 July, 1907.

the more lectures that be given by men of practical experience, the better it would be.

13771. Your second question is: "Can you suggest any practical methods whereby the giving of scientific instruction and information in agricultural subjects can be improved or extended?" There is not a word said in the reply where there is the slightest allusion to science?—I did not get any definite suggestions as to how the present methods could be improved except by increasing as much as possible the method of travelling instructors and having experimental plots scattered through the country.

13772. Will you kindly tell us what the feeling is in your county with regard to scientific teaching?—I think the feeling can be put in this way: that there is a general opinion that practical experience must come first, and that any scientific knowledge must come second as applied to practical knowledge.

13773. I think we shall every one of us be agreed on that point. To what extent would they welcome scientific instruction, and what sort of scientific instruction would the farmers in your county value?—As regards the improvement or extension of their knowledge of soils, manures and their application, and feeding stuffs, and practical advice respecting abortion, tuberculosis and other serious diseases.

13774. There is not a word in your *precis* as to the answers you received to that question except that you say: "The replies to my questions vary somewhat," and I thought you might give us some information as to what these varied answers are?—I do not think any of the answers gave any actual definite suggestion. The answers were to this effect: that they appreciated the spreading of experimental work so that they could readily see and understand the experiments, and they appreciated the personal visits and advice from persons able to instruct them.

13775. Is there any anxiety in the county of Lancashire from an agricultural point of view to have scientific teaching?—Yes, there is certainly an increasing desire.

13776. On the lines you indicate here with regard to soils, manures and their application, feeding stuffs, and so on?—Yes, the desire for that information is undoubtedly increasing very much indeed.

13777. And as to the purity of feeding stuffs and manures?—Yes. I have no doubt that farmers are very much more alive to the necessity of getting value for their money in manures and feeding stuffs, and are getting to know a great deal more about the comparative values than they ever were before.

13778. Is the Fertilisers Act carried out in your County?—Yes. Inspectors of Weights and Measures are appointed under the Act, and there are certain regulations laid down by the County Council for carrying out the Act. I may say the County Council had three prosecutions last year, and convictions resulted in each of the three cases.

13779. To allude to this question for a moment, it is one of the most important ones that you sent out, and there is not an answer I can see with regard to it as regards the management of cattle. Did they make any remark on it?—Some of the remarks dealt with abortion, which is a great plague in some parts, and I think they would like all the information and help, and all that is possible to be done to combat that evil.

13780. Did they express any great opinion on this return that we had made to us yesterday with regard to tuberculosis?—Not in the replies that I have had. I do not remember anything particular except generally that they would like information and advice and help.

13781. Did you hear the evidence which was given yesterday by Mr. Hale, as to the presence of tuberculosis in the County?—Yes.

13782. Can you send us some further information with regard to that and as to whether those figures are correct?—Yes, I will do that.*

13783. I may take it the diseases of animals is a question there is some interest taken in, although you have not referred to it here?—Yes. Undoubtedly that is of very great interest; and I might say the most successful courses of lectures in my personal experience were those given by a veterinary surgeon, who gave some most practical lectures—I heard some of them myself—in a simple way, and they proved of the greatest benefit in the way of giving practical advice to farmers.

13784. (By Lord Barnard.) Did those lectures include the subject of farm hygiene?—Yes.

13785. (By Professor Middleton.) I understand in your opinion the key to the whole situation is that the confidence of the farmer in each county must be gained?—Certainly.

13786. And that it is essential that you should have well-trained and also experienced instructors for the counties?—Yes.

13787. With regard to Hutton farm, that is managed by a Committee?—Yes.

13788. Is that Committee composed of men who are practical farmers?—There are two or three practical farmers on it.

13789. And chosen because they are recognised as being amongst the best practical farmers perhaps in the neighbourhood?—Yes; they are selected as having practical farming experience.

13790. What is the cost of running the Hutton farm?—That is the balance-sheet for the 12 months ending April 1st, 1907. You will find it all classified there. (Handing document.)

13791. This was put in yesterday?—It was.

13792. Your experience is that local experiments are likely to be more useful in Lancashire than a central farm?—Certainly.

13793. I understand that your central farm is not equipped in any way with laboratories; you have no chemist or botanist attached to it?—The permanent dairy and poultry schools are located on the Hutton farm, and for these suitable class rooms and a chemical and bacterial laboratory have been provided. Analytical chemistry is carried out at the Harris Institute.

13794. I understand that 50 per cent., or rather more than 50 per cent., of the students in your institution are the sons of practical farmers?—Yes, they come from that class.

13795. I find that 83 or nearly 84 per cent. of those whom you turn out become agriculturists; they either take up teaching or take up practical farming?—Yes. You are including all except the 24 and the three in the return.

13796. Yes; 83·4 either become teachers or go back to the land?—Yes, if you deduct the teachers, barely 60 per cent. go back to the land.

13797. You expressed the opinion that the figure was not quite satisfactory?—Only from the point of view of the total number of students as compared with the total number of the farmers in Lancashire.

13798. It seems satisfactory to me because 50 per cent. of those who go in are not agriculturists, and yet you turn out 84 per cent. who take up agriculture in some form or another?—I suppose they would not go in for it unless they had a natural bent in that direction.

13799. It seems quite satisfactory?—It is satisfactory from the point of view of individuals attending the classes.

13800. It is not satisfactory having regard to the total farming population of Lancashire; but from the number you take in and the number you turn out it is quite satisfactory?—Yes. You will notice what I say. "The number of 85 out of a total of 159 who have joined the ranks of working farmers does not appear very satisfactory from the point of view of raising the standard of farming knowledge in Lancashire, taking the large farming population of Lancashire into consideration, especially when it is remembered that almost all the 29 who took to the teaching profession are engaged elsewhere

* The Witness subsequently forwarded the following statement to the Secretary:—

The figures referred to by Mr. Hale related to certain lots of cattle that reacted under the tuberculosis test at Hutton and one or two other places some 10 years ago, and personally I do not think it safe to make positive deductions from percentages of reactors as to the existing prevalence of tuberculosis in cattle generally, and still less as to the extent of its presence in forms dangerous to human beings. In my opinion it is only data derived from general and systematic inspection by competent persons of cattle after slaughter that can be relied upon in estimating the prevalence of tuberculosis in the country as a whole, or in any given area.

than in Lancashire." It is quite satisfactory from the point of view of individuals.

13801. (*By Mr. Medd.*) The balance-sheet you have just put in represents the last statistics, does it not?—Yes.

13802. It varies very considerably from the statistics issued by the Board of Agriculture, so that the questions which I had intended to ask you are no longer necessary. The only observation I would make is that the amount expended upon farriery and veterinary science appears very small—£8?—I agree with you.

13803. It is to cover a big county like yours?—Yes.

13804. However, some of it may be included in other accounts. That may be so?—I understand that in that particular year that £8 for farriery and veterinary science was paid for the lectures to which I made special reference, given by a practical veterinary surgeon; there were other lectures, but they do not appear in that year's payments.

13805. In your *précis* you introduce a paragraph about the defective training of elementary school children?—Yes.

13806. I think Lord Barnard recommended you to refer it to the Board of Education?—I think it would be advisable for you as a Committee to present this matter yourselves to the Board of Education.

13807. May I ask you, in addition, if your very influential Education Committee will make the same representation to the Board of Education?—Our Agricultural Sub-Committee?

13808. I should say the whole Council?—I cannot answer for the Council.

13809. Of course, you cannot pledge them yourself, but you might try to induce them to do it?—Yes.

13810. With regard to the inefficiency of the ordinary rural teacher, your county might select a few to get an additional third year's training at some horticultural or agricultural college?—Yes.

13811. Rules are not yet issued, I might say?—No. The whole question of rural education is now being considered by a sub-committee, and it is receiving the consideration of our County Education Committee.

13812. You might inform them that regulations to enable teachers to have this third year's training at an agricultural or horticultural college will be issued shortly?—I will be very pleased to do so.

13813. Of course they might not know when your committee sits?—The Education Committee meets the third Monday in every month.

13814. In regard to farming in Lancashire, are there any co-operative associations for farming?—Yes, there are five agricultural co-operative societies in Lancashire and one just on the borders of Yorkshire and Lancashire for buying purposes. Three of them are for purchasing farming requirements, one of them partly for purchasing and partly for working an auction mart, and two for dairy purposes.

13815. That is, selling?—Yes.

13816. Do you think that these co-operative societies can in any way be said to arise from education, or that the societies themselves create a demand for education?—I think the co-operative societies greatly help agricultural education, because there is no doubt about it that through the co-operative societies the knowledge

of the value of manure and feeding stuffs gets brought home to farmers.

Mr. W. F.
Brockholes.

13817. As soon as you teach a man how to earn a penny he wants to know how by better methods he can earn 2d.?—Yes; I think it is a most useful channel of conveying information.

13818. Of course, when it is once started in Lancashire, it will go. In one remark you made you said that your students had no university to go to for an agricultural degree?—We have no agricultural college in the county such as the Leeds college, but at the same time I think I am right in saying that the whole course at the Harris Institute lands its students very high up.

13819. It gets them up to the National Diploma?—Yes.

13820. Would you not be prepared to support the movement in favour of the agricultural department in Manchester?—I should not like to commit myself off-hand to an opinion. We are doing very good work on certain lines, and I should not like off-hand to commit myself to any positive expression of opinion with respect to any change of policy.

13821. No; but Manchester will be offering opportunities which you cannot, in other words research for post-graduate men and an experimental farm. What I have in mind is the combining of Lancashire and Cheshire and Derby for the purpose of providing all types of agricultural education, so that any resident within those counties can profit by them?—Derbyshire would not work in with Lancashire at all events.

13822. Derbyshire has nothing at present?—No; but Derbyshire would work in better with Nottingham.

13823. Of course, that is for the Derbyshire people to consider?—Yes; you see how Derbyshire runs right away along Nottinghamshire and from Lancashire.

13824. Yes; but my first idea was Stafford, and my next idea was Derby?—There is the Harper-Adams College for Shropshire and Staffordshire.

13825. Yes; there is no reason why Harper-Adams should not affiliate with Manchester. My aim would be to get that part of the country better provided for?—Is there a need for that? You have got facilities now offered by the Agricultural Sub-Committee of Lancashire and the Harris Institute combined; you have got Holmes Chapel for Cheshire; and then when students get beyond those institutions by attaining scholarships, they can go to Edinburgh or to Leeds or elsewhere.

13826. The expense would be greater than at Manchester, and I should have thought you would have preferred to have had Manchester as an adjunct to your own local university, where you would be in touch with the men, and where you would know the professors. However, that is a matter only for consideration and to be definitely brought forward when Manchester has its agricultural department to offer you?—Is not that generally a matter of policy? That is hardly for an individual, but more for the whole of the county committee to consider and express an opinion upon.

13827. Quite so; but you are here to-day in a representative capacity, and one hopes that you will spread any views which you may hear here with which you can agree?—Yes. Before retiring I should like to put in this statement showing the occupations of the parents of the dairy students. (*Handing document.*)

Mr. A. E. HUMPHRIES, called and examined.

13828. (*By Lord Barnard.*) You are the Chairman of the Wheat Growers' Association?—Yes.

13829. Do you know the terms of reference to this Committee?—I do.

13830. You are anxious to give the Committee the views of the Wheat Growers' Association on this subject?—It might be well if I were just to state my official position as President of the National Association of Millers, and that I am the originator of what is known as the Home Grown Wheat Committee. I might also

add as one of my qualifications that I am farming for profit.

13831. Whereabouts do you farm?—In Surrey.

13832. A large area?—About 300 acres.

13833. Principally arable, I suppose?—A mixture, but mostly arable. When I was asked to come here, I inquired whether this Committee was confining its attention to facilities for imparting knowledge previously acquired to students or scholars, because I do not feel competent to deal with that side of the question at all.

Mr. A. E.
Humphries.

4 July, 1907.

Mr. A. E.
Humphries.

4 July, 1907.

I have done no teaching at all, and I do not want to have anything to say on that side of the question, but as the Committee seems willing to take the wider view, that is to say the necessity or the wisdom of doing research work, I am glad to come and say what I think on that subject.

13834. I do not know who gave you to understand that. It really is a little outside the scope of our inquiry, but at the same time we feel that it is a subject that we cannot exclude altogether?—Might I interject that I will be brief. I will not take up your time very long. What I want to say really centres round two propositions. The one is that in my belief there is an immense amount of profitable research work to be done. The second proposition is this: that it is unreasonable and unprofitable to expect men who have to teach and do "hack" work of various kinds for a living, and to take up high-class research work at the same time.

13835. Their province really is to disseminate the information that has been gained by others in research work?—Yes. Then dealing with the point as regards the necessity for research work, of course the outstanding case that appeals to anybody, the man in the street if you like, is such a case as that of Lawes and Gilbert. The work that they have done stands to their everlasting credit, but it seems to me distinctly discreditable to a nation of our standing that we should expect such work as they have done to be done, as it has been done, on private resources. I do not come here to advocate any rash or very great expenditure, but I do think that it is wrong to expect the work of the nation to be done by private individuals in the way that those two men did it. There is other work to be done in that direction, some is being done by individuals simply of their own initiative, and that is not creditable to the nation, and shows us up, very badly as against other nations of the world, who take the view that I myself take, that research is a national matter and ought to be subsidised by national funds. If research is not going to be profitable, it should not be done, but I take it nobody in existence would say that there is no profitable research work to be done. Might I take for instance this work with which I am more intimately connected, and of which I know most. Take the question of the quality of English wheat. It is very difficult to arrive at a true comparison between the value of different wheats, because terms differ, and weights and such things, but the English farmer has had to accept considerably less money for his wheat than the Manitoba farmer and farmers in similar positions, and that is due almost entirely, as we are proving, to ignorance. The English farmer stands at the top of the tree as regards yield, and an immense amount of work has been done in connection not only with wheat but with other things as regards yield, but it seems to me as a general proposition that when it comes to the question of quality there is an immense amount of work that ought to be done. The whole crux of the question from my point of view, so far as the value of English wheat goes, is simply the lack of certain qualities which we are proving can be produced in England. A great many years ago the National Association of Millers began to move in the matter, and appealed to the existing agricultural societies. Those societies simply ignored the matter entirely and took no notice of its appeal. It then applied to seedsmen, and the seedsmen said:—"All the farmer is troubling about is a large yield." I might also say that speaking generally port-millers do not care now-a-days much about English wheat at all. So that it amounts to this: that the work that we have been doing with every prospect of success would not have been done if it had not happened that there were a great number of millers who were also farmers. It is not an uncommon thing to find a combination, in the inland districts at any rate, of a man who is at the same time a miller and a farmer, as I am myself, and if it had not been for that happy combination the question of raising the quality of English wheat would not have been taken up at all.

13836. You use the word "we" very often. Who is "we"?—In this particular case "we" means the Home Grown Wheat Committee. We started the work. First of all, we got into contact with Wye College, and then we got into contact with Rothamsted, and, very much to our benefit, we got into contact with Cambridge University also, and we have developed a very wide field of what is *bona fide* research work. As a result I think we can safely say we are going to produce wheat

in England that will be worth some shillings a quarter more than the average quality of English wheat. That I most fully believe, and have the best of reasons for believing, but that would never have been possible if it had not been for the research work that has been carried out, research work that the agricultural societies would not undertake and do not undertake, and if it had not been for Rothamsted and Wye and Cambridge collaborating with millers the work would never have gone forward. I am taking that as an illustration of what I mean; it is typical. There is plenty of other work to be done and that ought to be done, and if some central association or body who would undertake research work were established at whose disposal were put the best possible brains at present at work in that direction, so that they could be entirely relieved from the necessity of having to carry out all this other work that I have referred to as well, it would be a most excellent thing, and a thing that is a matter of national concern in my view. Take again my own case as a farmer. I am troubled with scab in potatoes. It appears that some land that I have has been known to raise scabby potatoes for the last 20 or 30 years, not every year alike; it varies a little. Another thing I am troubled with, I have got two fields which two years out of three—I do not think I am stating it too highly—give us crop failures. As I am a Surrey farmer and am in touch with Wye College I straightway applied to them, and I should like to say whenever I have applied to the Wye College people they have always been extremely willing and anxious to do anything that would assist. At any rate, I applied to them, and they immediately came down or within a very short interval and began to look into these questions for me, and we were seeing what we could do to remedy these things, to ascertain if we could the cause of the scab in the potatoes and if we could not possibly arrive at some method of dealing with the bad land, but the position is this: that they have come down and seen me and had a discussion, but they have had to go back to the College, and switch off straight away on to teaching youngsters the elements of agriculture. That is a very desirable thing, and I have nothing whatever to say against it; but the real point is this: that if the scientists were on the staff of a central body to tackle things like that, and that alone, and not have to switch off on to all kinds of other duties, it would be infinitely better and the work could be done and be done well. I do not myself see how you can satisfactorily do the work that has to be done in the way of research if a man has to spend the greater part of his time in teaching.

13837. You do not go on to tell us what these gentlemen who came down from Wye College did in your case. Is that the end of it? Did nothing more happen? You told us that they went back and switched off on to teaching youngsters, but of course that is only an assertion that you make because you have no personal knowledge as to whether that is what actually happened or not?—It amounts to this. They took one sample of the soil 10 months ago, and they have examined it, and they say it is quite obvious there is something wrong, but they cannot say what, and whether they are prosecuting that inquiry or not I do not know, but my suggestion is that they have not the time to do it even if they wished.

13838. That is only your own suggestion. They have not told you that that is the fact, have they?—No, that is only my suggestion, but I think I am right in saying at any rate that if a man has to do this research work, and has to do teaching at the same time as well, it is only natural that he has not sufficient time to give to it. The whole point of my suggestion is that these two things are typical of points which occur in ordinary practice, and it seems to me that a great amount of research work should be going on in the country; and the next thing is that to ask a College such as Wye College, which is crowded out with scholars, to take up research work in addition to their ordinary teaching duties is asking them to do things that they should not be asked to do, and things that should only be given to such people as specialists as a special subject. I happened to hear a mention this morning of abortion in cows. A connection of mine farming in Surrey is pestered with that complaint. But to go back to wheat. We have not nearly finished our work in that direction yet. Take the one point of rust resistance, that is, wheat which shall be resistant to rust or resistant to bunt. That is a subject that means highly technical work—it is a sort of work that I grant you is already being attended to at Cambridge University, but it is a thing that should come within the scope of a

13833a

13835a

13838a

Mr. A. E.
Humphries.
—
4 July, 1907.
—

national movement. You get in Australia, for example, a Government Department dealing with such things. The late Mr. Farrer has done a great amount of work on that line. Cambridge has opened up fresh lines altogether, and is likely to make a very considerable improvement in the matter of rust resistance. There is hardly a wheatfield in the kingdom that does not suffer much or little from rust, and you want to carry out research in order to arrive at a wheat that has an inherent tendency to resist bunt and rust.

13839. I think you have proved sufficiently to us the necessity of further research, but I think you will agree with me that it is scarcely fair to compare this country with our colonies inasmuch as the development in this country has been going on for many centuries, and a great many problems settled, whereas Australia, which colony you mentioned, is practically an entirely new field, where a variety of problems are not yet settled and where they require the need of much more attention being paid to them than is the case in this country?—My answer to that is that the experience we get from actual practice is that we do not know as much as we ought to do of the things that are to be known; we have got definite evidence of that.

13840. Do not you think it is possible in a newly opened up country like Australia it is more necessary to do this kind of work than in an old country where a great many of the problems have already been settled?—I do not take that view at all, my lord.

13841. Do you or do you not know as a matter of fact that the question of further research on these points is being very carefully considered, and has for some time past been under the consideration of the Board of Agriculture?—I know unofficially that it has been under consideration, and if anything I can say will help that forward so much the better.

13842. When you say unofficially have you seen any documents or papers?—No.

13843. You have only heard it talked about?—That is so.

13844. You are aware that something has been done. Have you approached the Board yourself on the subject?—On the specific point as to whether research should be undertaken in a general way, no; as regards the question of the improvement of wheat, yes.

13845. (*By Professor Middleton.*) You have yourself received grants for specific purposes?—Yes.

13846. You are not speaking on behalf of yourself only; you are speaking of these other bodies with which you are connected?—As a matter of fact I was only telegraphed for yesterday, and I have no mandate so to speak from the bodies or to pledge them in any way, but I have no doubt whatever that I am representing the views of millers generally.

13847. From the point of view of the prosperity of the agricultural industry you wish to impress upon this Committee the absolute necessity for a greater amount of research work being carried out in this country?—Yes.

13848. That is your first proposition, and in the next place you consider that that research work can only properly be conducted by people who devote their whole time to it?—Yes.

13849. (*By Mr. Latham.*) I have no doubt you recollect Mr. Hall reading a paper before the Farmers' Club some time ago on the very subject you are talking about?—Yes.

13850. That was probably the thing that brought the matter more prominently before farmers than anything that had ever happened before?—That is correct.

13851. You have stated, and I agree with you, that the great cause you have so much at heart should become a national one?—That is right.

13852. And that some help should be given to such people as yourself and others who are working with you to bring to a satisfactory conclusion the question why foreign wheats have such a great advantage over our own?—That is it, and we do not consider the question of the strength of wheat is the only thing. We think the health of the plant, the rust and bunt resistance, the quality of the straw, and everything should be taken into account, and we are of opinion that in all those respects great improvements can be made.

13853. In consequence of the very large importation of foreign wheat into this country you will agree with me that our English wheats have declined?—In quantity.

13854. Both in quantity and in quality. I will put it the other way. There has been more notice taken of growing wheats that yield than of the value of wheat with regard to its strength and so on?—Yes. I would like to amplify that. The general scientific conception until within the last five years was that it was impossible to combine yield and quality. The work we have been undertaking, and it is very far from being finished, goes to show that that was a mistaken scientific conception altogether, and that it is possible to combine yield with quality. The whole drift of the seedsmen's work, because it was practically all seedsmen's work, was for them to study yield as a means of increasing the financial return. We say that was a mistaken scientific conception, and although you have certainly increased the yield you should increase the quality simultaneously, and that is a question of research work.

13855. That is because the foreign wheat is so strong, and the Englishman could not compete with them in that respect, so that he has grown a weaker wheat, but of greater produce?—That is right.

13856. I suppose I may take it that our climate is very much to our disadvantage?—One's ideas on that begin to wobble. We are proving that certain wheats appear to be able to withstand unfavourable climatic influences.

13857. Do not good and strong wheats suffer from such seasons as we are passing through more than the weaker ones?—To a certain extent, but any proposition of that kind must always be considered relatively. •

13858. That arises from our ignorance on the subject?—That arises from ignorance. Of course a bad season is going to reduce the quality of wheat, but perhaps not to the extent that is thought, because assuming you have a good wheat and a bad wheat in England the fact of bad weather affects both, so that the relative superiority of the better wheat would still remain.

13859. That is one of the great works that you are devoting your energies to?—Certainly.

13860. With regard to your remark about scab in potatoes did you ever mention that to the Board of Agriculture?—No.

13861. Have you any Correspondents of the Board of Agriculture in your neighbourhood?—Yes, I believe we have.

13862. I am rather afraid you do not worry them much when you get into little troubles like that?—That is quite right.

13863. In all probability if you had reported this to the Board of Agriculture some notice would have been taken of it?—It is possible. I am not in the faintest degree attacking the Board of Agriculture, you understand; quite the reverse. They have shown a very great interest in the work that I have at heart, but, as a matter of fact, I did not correspond with them with regard to the scab in the potatoes.

13864. I am a Correspondent myself, and if I had suffered as you appear to have done, I should have applied to the Board of Agriculture, and tried to find out what my potatoes were suffering from?—Well, if I had applied to them they would probably have referred me to Wye College, and I went to Wye College direct.

13865. You do not consider that these colleges are not taking up this question?—Oh, no.

13866. You look upon them as great adjuncts in this particular work?—Certainly.

13867. The object of your coming before us to-day is to try and show that the wheat-growing industry in England will be improved very much by the great work you are carrying out?—I do not want to blow my own trumpet.

13868. I can blow it for you. We are sitting here to try and get more help from the Treasury for agricultural purposes, and we look upon it that the work you are carrying on is one of those purposes?—Quite so, and I look upon it as typical of what could be done in other directions.

13869. (*By Professor Middleton.*) I quite agree with you as to your general views with regard to the necessity of research, but I am afraid I cannot accept your second

Mr. A. E.
Humphries.
—
4 July, 1907.

proposition, which is, that in order that we may have satisfactory research we must separate education and research. Upon that may I ask you, first, who it was that has produced this new wheat to which you have been referring—who made the crosses?—Cambridge, undoubtedly.

13870. Who did it?—R. H. Biffen.

13871. Who is it that proved the inheritance of disease to which you refer?—R. H. Biffen.

13872. May I ask you who has practically done the actual work in connection with the production of the new wheats up to this time?—The research work—R. H. Biffen.

13873. Has not Mr. R. H. Biffen been teaching all that time at Cambridge as well?—He teaches 24 weeks in the year, I believe.

13874. He teaches a good deal more than that, I am afraid?—At any rate, my point on that is this—anything I could say to the credit of Cambridge I would say with enthusiasm, but I do want to make this point—that in the case of a University you have very short terms, and R. H. Biffen would never have been able to have done this work if he had not worked all through the vacations and on Sundays and at all conceivable times.

13875. I am not arguing in this particular case either for a man or a university. I only wanted to show that your point, that you could not associate teaching and research, in that particular case was not proved?—I did not say it was not possible to do it. I said it was unreasonable and unprofitable to expect men to teach and carry out research work at the same time, and, if Mr. R. H. Biffen had not been an extraordinary man and worker, he would never have been able to carry out what he did.

13876. If you put it that it is unprofitable and unreasonable to expect a man to teach and carry out research work at the same time, I am afraid that I cannot agree?—If you will state a case I will see if I can agree with you.

13877. Would you agree that a man who was carrying out research might be required to give instruction to advanced students?—Yes, such students as were going in for the higher ranks of agricultural education.

13878. Any student who had passed the entrance examinations and was going forward for a degree—you would agree he would be required to teach students of that description?—I would far rather take what R. H. Biffen and yourself have to say on that point than express my own opinion.

13879. (*By Mr. Medd.*) I suppose you look upon Rothamsted as your chief experimental station?—Are you asking me with regard to the work with which I am particularly connected?

13880. Wheat more particularly?—No, I cannot say that. It has been an extremely valuable one, and immense credit is due to Mr. A. D. Hall in particular for the work which he did in the early stages, but the work which is going to make the greatest mark has been done at Cambridge, although I am most anxious not to set the one against the other.

13881. At a collegiate centre such as the Welsh one you would expect research work of this kind to be done?—I am sorry to say I do not know much about the Welsh centre, but subject to that I should say, yes.

13882. For the general purposes of agriculture, including investigations into wheat, you would like to see the rest of England, which is now white on the map, covered with collegiate centres where experiments might be done?—That is not exactly my point of view. It seems to me that if you were going in for research work, it may be better rather to centralize than diffuse. You might easily by collaboration with institutions in various localities find out the application of scientific discoveries under various conditions—climatic, soil, and so on—and my main point would be that research had better be done at one centre, where you had the people actually in touch with each other doing the work.

13883. You would not have in Cornwall, for example, the same climatic conditions and descriptions of soil as you would have in Yorkshire?—That is true; and that is why I said a moment ago that if you have a central research station I would obviously wish it to collaborate with the other bodies already in existence, or to be formed in different parts of the kingdom; but I would prefer an

actual central point where the workers were in constant touch with each other.

13884. Viewed financially such an experimental station would be in a better position than if it were working in isolation, do you not think so?—I would rather not express any definite opinion on the point of procedure in the way you have just raised it; but I do not think the expense ought to be greater by one central institution, working in collaboration with others, if it is required.

13885. Would you prefer the funds for your association to come direct from the Board of Agriculture or through the various local authorities?—When you say the association you do not mean the one I am already connected with; you mean the proposed one?

13886. Yes.—I want to answer that rather fully. The amount of money which the Millers' Association have had at their disposal for the work they have done barely pays their out-of-pocket expenses. The whole work they have done has been done gratis by everybody, and that is the one point I would like to rub in. In the case of Lawes and Gilbert, they did all the work that they carried out out of their own private means; and in the case of this Home-Grown Wheat Committee, we simply get a small grant of £50 a year from the Board of Agriculture and £100 from our own Association, which just pays our out-of-pocket expenses; but the whole backbone of the work is being put into it for nothing so far as actual payment goes; and here is Mr. R. H. Biffen working as a lecturer on a small salary, I presume—I do not know—but doing this great work for the nation practically for nothing.

13887. (*By Professor Middleton.*) Is it not the case that Mr. R. H. Biffen has never had a penny from the fund to which you have been referring?—Yes; not a penny.

13888. (*By Mr. Medd.*) I understand your object in appearing before us to-day is to emphasise the national importance of your work, and that it is entitled in your opinion to State aid?—Not exactly that, because we are going to muddle through somehow, as Lord Rosebery says—and perhaps we will do something more than muddle through somehow—but I am taking it as typical of the way in which the work we are doing, and a very large amount of the research work of the country, is treated, especially if you are breaking new ground. I put it in this way; that if you will not give us funds we will do without them, but England should not place work of that description in that position.

13889. Your view as a witness is, that the various institutions which could carry out this work should receive State aid, and which institutions are affecting your trade, the trade of farming and the trade of milling?—Yes.

13890. That is the way you put it?—Yes.

13891. (*By Lord Barnard.*) You have put forward a theory which is rather contrary to the past history and experience of Englishmen, that they should rely exclusively on the State for any work of this kind being done, and that it has almost invariably been done by individuals?—That is not my view at all.

13892. Then it is advisable you should correct the impression you have given?—My point of view is this: the State should undoubtedly help, but I most certainly would make provision for the recognition of individuals, and the embodying of individual effort. If you can do this, by all means do so. I am quite enough of an Englishman to go to that extent. I do not ask that the State should do the whole thing, but I do say that the State could do more than it does.

13893. I believe with regard to the Lawes work a large sum of money has been given to further that?—Yes.

13894. Englishmen are frequently reproached for not doing enough, and it is often said that Americans are far more liberal in their benefactions and endowments for educational purposes than we are?—Yes.

13895. If your theory were carried out—you have rather corrected it now—it would be discouraging rather than encouraging private individuals to do more in the way of endowments?—I must confess, if you ask me on that specific point, I rather think the Americans go to the other extreme. What I suggest is this: if Englishmen would take up a middle attitude, where they would recognise individual effort, and recognise that it should go on as part of a national work, that would be better than either the existing American or the existing English system.

13896. I was rather referring to the question of public

endowments?—I am not competent to speak on the educational side.

13897. Public endowments have been applied largely to research in the past, and I do not understand that you would discourage private individuals from leaving endowments for educational purposes?—Certainly not, but it is quite wrong, in my view, to expect the work to be done as it has been done in the past by individual effort.

13898. You say to expect, I do not know who expects it; probably you do. I think you a little jump to your own conclusion, and also as I began by stating I think you have overlooked the fact that the State is considerably interested in the question, and that something will be done, and that we shall not be left to muddle through. Professor Middleton asked you as to whether research work and teaching could not be carried out together. I do not know whether you are engaged in teaching or in research work?—I am not. I am simply collaborating with people who are engaged in research work. I have never taught, and do not teach.

13899. You have expressed a very strong opinion upon a point which I suggest to you you are not really qualified to express an opinion upon; that is as to the desirability of research work being totally dissociated from teaching. That may be your opinion, but you base it entirely on your own opinion?—You will pardon me if I offend you, but you might not have heard what I said to Professor Middleton, in which that attitude was modified to a certain extent, that is to say, that I do not think it is any detriment to a man engaged in research

work to teach the advanced students such as you would get in the highest ranks of Cambridge University; but I do not see the use of a man engaged in the highest research work teaching elements of agriculture or going about the country lecturing to people who *prima facie* know next door to nothing of the science of agriculture.

(Professor Middleton.) I may say that Mr. Humphries has done a great deal of work in collaboration with Cambridge and Rothamsted, and that his opinions are entitled to great respect.

13900. (By Lord Barnard.) It is a matter for the researcher himself, is it not, to say whether he can best employ his time in limiting himself exclusively to research, or whether it is to his advantage to do some teaching at the same time?—I said a few moments ago that if Mr. R. H. Biffen and Professor Middleton, with whom I have collaborated considerably, are of that opinion, I would sooner take their opinion on that question than my own. But I do think, nevertheless, that if a man is engaged in research work that he has got enough to do, and that he should not be wasting his time in teaching elementary agriculture.

13901. You are assuming that he is wasting his time. We have had no witness here who has stated that he cannot devote his time to research work because he has to waste his time in teaching?—My illustration is that Mr. R. H. Biffen's time is so valuable to the country that it is a pity that any of such valuable time should be taken up in doing elementary work.

Mr. A. E.
Humphries.
—

—

13899a

Rev. W. WILKS, M.A., called and examined.

13902. (By Lord Barnard.) You are Secretary to the Royal Horticultural Society?—Yes.

13903. You have held that position for some years?—Ever since 1887.

13904. Your Society has for a great many years done a good deal of work in encouraging scientific and technical education?—It has done all that it can, ever since the year 1822. I can begin at 1822.

13905. Perhaps it would save your time and ours if I say that we will be satisfied to take it that you have done some work in this direction for a great many years?—Yes.

13906. Perhaps you would come now down to more recent times and tell us the later steps?—Shall I begin at 1893?

13907. You might go back to 1866?—From 1866 to 1872 we instituted examinations for gardeners in conjunction with the Society of Arts. We established a committee to consider gardeners' education. That committee consisted amongst others of Sir Wentworth Dilke, Mr. Robert Fortune, Sir Joseph Paxton, Mr. James Veitch, Mr. Rivers and Mr. Paul; they went very carefully into the question of the examination of gardeners, and came to the conclusion that the only way it could then be done would be in conjunction with the Society of Arts, which held examinations all over the country. The Society of Arts cordially accepted our invitation to work with us, and we together examined gardeners all over the country at the Society of Arts' examinations, and we gave prizes.

13908. That only lasted for a few years?—That only lasted for a few years—from 1866 to 1872.

13909. Why was it dropped?—I cannot tell you that.

13910. Nothing was done by the Society for a good many years after that, I think?—Nothing, so far as I know, was done between 1872 and 1892.

13911. What did you do in 1893?—In 1893 we started a general examination in the principles and practice of horticulture for gardeners all over the country.

13912. What induced you to start that?—My own feeling that such a thing was desirable.

13913. Has that examination gone on down to the present day?—It has gone on down to the present day.

13914. And still continues?—It still continues.

13915. Are you only an examining body, or do you give instruction?—We are only an examining body as regards this general examination throughout the country.

We give instruction at our gardens, but that is entirely a separate subject.

13916. Do you grant a certificate or diploma?—We grant a certificate to every one that passes the examination.

13917. Do you find many candidates come up for examination?—Yes, a great many.

13918. What is the result; are the candidates that pass your examination able to earn higher emoluments?—Decidedly; I can give you some of the figures; the number who go in for these examinations varied from 236 in 1900 to the lowest number we have ever had—150 this year.

13919. What class of men go in for these examinations?—Gentlemen's gardeners and foremen, and improvers, and such like.

13920. A man must have a certain amount of scientific knowledge, must he not?—Yes, he must have some amount of scientific knowledge, because he must pass the examination both in practical and elementary science.

13921. Do any elementary schoolmasters from rural districts come to you for instructions?—That is another branch that we established in 1904: an examination for teachers and pupil teachers connected with elementary and technical schools.

13922. Has that been successful?—That has been very successful; in the four years that it has been going, 601 teachers have entered for the examination.

13923. Then you have a third examination?—We have a third examination which was established only last year—we have only held it in 1906 and 1907 at the instance of the London County Council—for men employed in public parks and gardens throughout the country.

13924. Do you charge a fee to candidates?—We do: it is 5s., but it does not anything like cover the expenditure; it simply is, if I may say so, to ensure that the man going in for the examination *bona fide* wishes it; that he does not do it simply for a joke or out of mere curiosity.

13925. At what age do they generally come up?—That I cannot tell you.

13926. Can you tell me at all whether they are fairly well educated. Is the spelling and that sort of thing good?—They vary enormously.

13927. Do you think since this system was instituted in 1893 that there is a general improvement in the

Rev. W.
Wilks, M.A.
—

Rev. W.
Wilks, M.A.
—
4 July, 1907.
—

educational qualifications of the candidates?—A most distinct improvement is reported by the examiners.

13928. You wish to put before the Committee some of the difficulties with regard to the education and examination of gardeners?—The difficulty, of course, of an examination for a gardener lies in the enormous scope which a gardener's education must necessarily cover. It is not the same as with agriculture, where you have to deal with perhaps a dozen different plants and half a dozen different animals. In the case of a gardener you have 1,000 different plants to deal with—collected from all parts of the world, from the poles to the equator—and they all require different treatment, different soil, different temperature, different moisture, and things of that description, and it cannot be treated in a mechanical manner at all. No hard and fast rules or laws can be laid down. Then as regards the difficulty of the class from which gardeners come, it is evident at once that they come principally from boys leaving the elementary schools at the age of 13; their parents cannot possibly afford to keep them without the earning of wages, and the earning of wages is very detrimental indeed to any subsequent education being imparted to them, except that of what we may practically call a rule-of-thumb method.

13929. Then, as to the inherent defects in the examination?—The defects in all our examinations are also very evident—they lie on the surface. We cannot possibly examine practically. We cannot take the men to a garden and say, "Now dig that piece," or to a fruit tree and say, "Prune that tree," because the gardeners come from all over the country—from north of Scotland, to the South of Cornwall—and they could not possibly afford to be all brought together at one centre to be examined together at one time, nor could we afford to send skilled examiners into every district in the country.

13930. Have you any suggestions for improvements in this respect; do you think anything could be done?—With regard to the last point?

13931. Yes.—No, I do not think myself that anything can be done. I believe it to be inherent.

13932. You think your Society is doing good work at any rate in levelling-up and improving the scientific attainments of practical gardeners?—I am quite sure we are.

13933. Will you tell us something of your students and of the people you teach?—We began on a new system in 1894, and we teach them in our gardens all the practical methods of horticulture, but up to the present time we have not been able to teach them what you would understand as science; we have not been able to teach them such things as chemistry, physiology of plants, or such points. We have simply taught them the best methods of gardening from a practical point of view, and those men have almost invariably turned out well. Do you care for me to tell you what they have done?

13934. At what age do they come?—We limit the age from 17 to 20.

13935. They are quite young men?—They are quite young men, and we keep them for two years.

13936. Do they go through the examination at the end of the two years?—Not necessarily, but as a general rule they do; it is voluntary on their part.

13937. Do not give us too many instances, but generally speaking, what becomes of these young men?—One is a curator in the West Indies at the Botanic Gardens; another is head-gardener to Baron Rothschild in France; another tea-growing in India; another is assistant at the Kew Arboretum; another is assistant at the Imperial Institute; another the Editor of the "Madras Observer"; another is on the staff of Reading College; another is on the staff at Kew; another is on the staff at Wye College; another is horticultural instructor under the Government of Denmark; another is at Dublin University, teaching; another is at a botanical station in West Africa; another is at the University at California, and so they go on.

13938. Are many employed in England in actual gardening?—Not very many of these students become actual gardeners, because they rise above it.

13939. Do you give any scholarships?—In conjunction with the Worshipful Company of Gardeners, we always keep one scholarship going—for two years, you understand. Each year the man who passes our general examination first has the option of a scholarship of £25 a year for two years' study at our gardens at Wisley. He holds it for two years. Each year the head man has the offer of

it, and if he does not accept it for any reason, the second man has the offer, and so on through the first class.

13940. Do you do any research work?—We have not done any distinct research work up to the present, but we are at the present moment inaugurating on the 19th of this month a research station at Wisley which has been properly fitted up with all scientific apparatus for the purpose.

13941. Will that be done entirely at the expense of the Society?—Entirely.

13942. The Society is very flourishing at present, is it not?—I am happy to say it is; we have an income of nearly £20,000 a year; but may I say this, I do not see that that is any reason whatever why the State should not help.

13943. You were in the room when the last witness gave his evidence?—Yes.

13944. Do you agree with the view he expressed that research work is very necessary?—I agree that research work is intensely necessary.

13945. And that it is a national work and that the State ought to bear some of the cost of it?—Decidedly.

13946. To take the case of gardening, more especially in connection with, on the one hand, the wages of the men employed in the industry, and, on the other hand, the interest of the consumers of vegetables, you think that is desirable?—Certainly.

13947. From both of those points of view it is desirable that the State should give assistance?—Yes.

13948. I think I am right in saying you are a clergyman in a country parish?—I am.

13949. A rural district probably. I should like to ask your opinion on gardens in elementary schools and teaching nature study. Have you paid any attention to that point?—It has come before me not as being a country clergyman, because we have no facilities in my immediate neighbourhood for school gardens; but it has come before me, as Secretary of the Society, and I cannot help thinking that a very great deal of good has been done by school gardens. There is one schoolmaster, as an example, somewhere in the neighbourhood of Plymouth. I forget the exact spot now, but perhaps Dr. Somerville knows, who has done immense work for gardening in that way, in encouraging the boys' tastes in that direction, and guiding them on the first principles of what they should do and what they should not do.

13950. Do you think that is a good form of education for men who are going to be gardeners in future life?—I think it is decidedly better than the principle of nothing, which most of us pursue. I say my own schools cannot—of course, they have ceased to be our own schools—but in the schools with which I am connected, and which I built and so forth, we have no facilities for a school garden, otherwise I should have set one up long ago.

13951. Then you recognise that it is not always practicable even in country places to have school gardens?—Oh dear, no; it is not always possible.

13952. Are there any other points you would like to bring to the notice of the Committee?—Before we pass away, you mentioned nature study. I am afraid I am rather a heretic on the question of nature study, because I cannot help thinking and saying that many of our British plants have been destroyed almost by this intense search after specimens. I am a great searcher myself, but I never touch a plant unless there is an abundance of it, and I never take more than one or two at the outside; but you cannot expect boys and girls at school to discriminate very largely, and whenever they see a rare plant they grub it up at once, and, by the way they take them up, they can never be expected to live. The same with butterflies, and I may tell you that I am now engaged in going about the country on my bicycle all over the place collecting caterpillars and bringing them back and putting them in a secluded place. I am not absolutely in the country. I am in the neighbourhood of a large town, and you can see troops and troops of young people coming out on the Wednesdays and the Saturdays, and they strip everything. There is not a fern or primrose to be found in my whole neighbourhood, and there is not a butterfly either to be found, except those I bring back with me.

13953. Are there any other points you wish to bring to the notice of the Committee in connection with scientific and technical instruction, and the facilities now afforded for that?—You will remember that my sphere is entirely

Rev. W.
Wilks, M.A.
—
4 July, 1907.
—

gardening. I know nothing about agriculture except what I observe with my eyes.

13954. The functions of agriculture include gardening?—Quite so. There is only one thing I think that practically could be done to encourage and improve these lads leaving school and going into gardening, and that is, if during the last year of their stay at school the boys could be asked particularly what line of life they were going to follow, and that then part of their time should be devoted to a proper text book on the subject to which they intend to devote their energies after they leave school, it would be an excellent thing. If a boy, for instance, when he is 12 were to say, "I want to be a gardener," and he had text books put into his hands, and made to employ part of his time in the study of them, he would be able to ground himself a good deal in the theory, and would pick up his work ten times more quickly when he goes to it than if he were to go to it as he does at present—absolutely ignorant of any details whatever.

13955. (*By Dr. Somerville*). With regard to this question of the destruction of flowers, have you ever thought of moving the County Council to make regulations on the subject?—No, I have not. I am afraid I am not a great believer in the wisdom of County Councillors in such matters. The County Council in my district have only exercised their powers in that direction in one matter, and that was by issuing a regulation that no lark was ever to be destroyed; the country swarms with larks.

13956. Do you know that the County of Devon have made regulations with regard to the grubbing up of flowers and plants?—Yes, I am aware of that.

13957. You have no reason to believe that that regulation is not effective?—I have every reason to believe that those regulations are not effective. Our Council at Croydon are the owners of a very large open space of ground covered with heather, and they have huge boards up, that anybody damaging the heather or taking it away will be prosecuted. Any day in the week when the heather is out you will see hundreds of people walking along the roads with bunches of heather in their hands walking down into Croydon and passing policemen and no notice whatever is taken, and I have every reason to believe that it is the same in Devon.

13958. (*By Mr. Latham*). If your young men when they leave you have no examination or diploma or degree, what are their qualifications as they pass on into life?—Every student that goes in for our final examination, and passes, has a diploma, but if he does not choose to go in for the examination it is his own fault.

13959. He has then no qualification at all, and it is no use his saying he has been with you if he has no qualification at all?—He has always the reference back.

13960. Would that be of much assistance to him?—It would depend entirely on what his character and diligence had been whilst he was with us.

13961. Is there any great exertion made to try and

get them to try and take a diploma?—Yes, and they almost invariably do take the diploma. The difficulty about their going in for the examination at the end is this, that their term may not end at the same time as the examination takes place, it may be that it is nine months beforehand and they may have gone right away by that time when the examination is held.

13962. I presume they could come up for examination then if they liked?—Oh! yes, they could.

13963. Do you not think it would be very desirable if they did?—Most desirable; and if they are in this country as a rule they do.

13964. (*By Mr. Medd*). You say great damage is done by lads from the town near which you live?—Yes.

13965. What age are those lads as a rule?—Every age from 8 to 18.

13966. Do you think any of them have been to a school in which nature study is taught?—I could not tell you at all.

13967. May I ask what the town is?—Croydon.

13968. I know nothing of it in Croydon, but the probability is that the children in those schools have never been yet taught to appreciate either insect or animal life, and that the very reverse of your experience would occur if those children had had that advantage?—I should be only too delighted if it were so.

13969. I would only ask you this point: do not you feel inclined to try and get your local authority or your schoolmasters to attempt the instruction?—In nature study?

13970. In nature study?—Well, that should be for the local authority to do.

13971. That is so; but as a matter of fact I think you would find no local authority to-day would oppose it, except possibly on the ground that they had no adequate teacher, and such a teacher they might obtain if only as a peripatetic. The matter is one that solves itself. It is most curious, I may tell you, that the best place for the study of nature is the centre of London. You will hardly believe it?—I can think it quite possible. It would not be unlikely that the boys who would observe the great buildings of London would be country boys who have never seen such before—and so London boys might be expected to observe Nature, having never seen anything of the sort before.

13972. It is so. The work done by the pupil, the concentration of effort and the general results are better in Whitechapel, in the east-end of London, than they are in the country?—It is quite possible.

13973. You are Secretary to the Society as a whole are you not?—Yes.

13974. The work of the Education Committee of your Society is expanding I think?—Yes. That is what it will be from the 19th of this month, on which day we open our new Laboratory and Research Station at Wisley. (*Handing document*.)

MR. J. A. VOELCKER, M.A., B.Sc., PH.D., called and examined.

13975. (*By Lord Barnard*). Would you be good enough to tell the Committee the exact capacity in which you attend here?—I am chemist of the Royal Agricultural Society of England and the Bath and West of England Society, the Lincolnshire Agricultural Society and others, and as regards education I am also examiner for the National Diploma of Agriculture and the National Diploma of Dairying; I also examine at Cirencester, and occasionally at Edinburgh and other places; I am also chemist to the Royal Horticultural Society of which Mr. Wilks, who gave evidence just now, is the secretary.

13976. You have considerable acquaintance with the farming community?—I have.

13977. You know their views and feelings and wishes to a great extent?—Yes.

13978. You know the terms of reference to this Committee—I daresay you have read them?—I have.

13979. Would you oblige the Committee by telling

them what your views are of the facilities which now exist for affording scientific and technical instruction in agriculture?—With reference to the colleges, and so forth?

13980. Yes.—If I was speaking generally I should say that the present was a time of progress and of satisfactory progress; I think also, speaking quite generally, that as far as my particular subject, chemistry, goes, it is very well provided for at existing institutions, to the extent that the ordinary agriculturist needs it to be taken, and I look for further development as the need comes, but I do not consider that, so far, there has been anything superfluous done, nor do I consider that the subject has been badly provided for. I think that it is capable of development, and that that development will be a natural one, but, so far, I think that through the impetus which has been given to agricultural education generally throughout the country, and through the checks by examination, and otherwise, that are placed upon its progress, good and efficient work is being done, and I look

Dr. J. A.
Voelcker.
—

Dr. J. A.
Voelcker.

4 July, 1907.

for an extension of that. At the same time, there are some directions in which I think a more decided line of progress might be taken, and there are also some lines on which I think a check should be placed—certain dangers that want guarding against.

13981. Are you prepared to indicate what those dangers are?—I am prepared to indicate the one that I am perhaps more particularly able to speak of, and that is, I consider that at our colleges there is a great mistake being made by the extension of the system of making the heads of departments and the students studying under them analysts instead of instructors.

13982. I am afraid I do not quite understand?—The danger that I fear is that our colleges are going far too far in turning out analyses for farmers instead of devoting themselves to instruction and research.

13983. I suppose we may take it from you that an elementary knowledge of chemistry is invaluable to a man who is going to work his own farm?—An understanding of it is a necessity.

13984. It enables him, for instance, to understand an analysis or any other report that may be sent to him by a scientific man like yourself?—He should have sufficient training in general chemistry, and chemistry applied to agriculture especially, to be able to grasp the points contained in analyses of the subjects relating thereto.

13985. You would very much deprecate any attempt to make him a scientific chemist rather than a farmer?—I think that that is going beyond what is contemplated by agricultural education.

13986. At the same time, I suppose in the case of some of these colleges you would not deny that it is desirable that they should in some individual instances extend the teaching very considerably in consequence of the necessity of their having to train teachers as distinct from farmers?—I approve of it thoroughly so far as the training of teachers goes, and of the training of their students to give them a knowledge of what is involved in analyses and the understanding of analyses. What I deprecate is the making use of public money, given for educational purposes, for what I may call this commercial work—work which is amply provided for elsewhere, and the attention given to which means the taking away of that time which ought to be given to education in the right sense of the word, and to research work.

13987. Where are members of your own profession (chemists) trained, may I ask?—There is very strong feeling, and there have been many representations to the Board of Agriculture by our professional bodies, on this very point, of the training of chemists. They have attended as deputations to urge their views on it. I have the particulars before me now. The Institute of Chemistry in particular has made strong representations, and successive presidents have dealt with it, Sir William Ramsay and others having expressed themselves very strongly on the point to which I have referred as affecting the progress of professional chemistry as a whole throughout the country. They have pointed out that such work as is in many cases done by colleges, ostensibly for the benefit of the farmers, is not a matter in the nature of agricultural education at all, and ought not to be provided for out of money given distinctly for the purpose of education. They have further pointed out that the work is already admirably done by different agricultural societies who employ qualified men for that work, and that, if the practice to which they object is continued in, it must be bound to have a bad influence upon the advance of professional chemistry as a whole, inasmuch as the work done at colleges is not under any control at all, and that no qualification is needed from the man, no certificate of competency, and so forth, so that the general tendency is to depreciate the whole subject of agricultural chemistry in the public view, and to act detrimentally with regard to the position of men already holding public positions, and also to discrediting and discouraging individual work.

13988. Am I right in gathering that your remarks deprecate any analytical work being done by professors in colleges?—That is so.

13989. I should like to know, if I might, where members of your profession get their training generally?—Members of our profession get their training at the recognised institutions in the country—at our universities and colleges; the Institute of Chemistry insists upon a five years' course, three of which must be a distinctly collegiate or university course, and that has to

be followed by two years of practical work with some Fellow of the Institute where they will get their special training; then it also certifies their competency by means of examination.

13990. I do not think, if I may say so, that we have had evidence to the effect that either teachers or students undertake work which could be more profitably done by chemists like yourself. In fact, so far as I can recollect, your information is a revelation to me. I had no idea that students or teachers did do such work?—I can assure your lordship that it is a very common thing, and this matter is constantly engaging the attention of the Institute of Chemistry.

13991. Unless, of course, they were qualified chemists like yourself. I did not mean to say that I did not think that teachers ever did it, but my impression was that only those teachers did it who were properly qualified?—What we as professional chemists object to is, the time of agricultural chemists at colleges being taken up by doing work, in many cases, for outside people altogether, through the facilities given by grants from the Board of Agriculture, and of these I have a number of instances that I can give.

13992. Do you think that anything further should be done by the State or by local authorities for agricultural instruction?—Agricultural instruction generally?

13993. Yes. Including, of course, such a measure of chemistry as you have just referred to as necessary?—I cannot suggest any wide departure, but I would advocate a pursuance of the present lines with extension more in the direction of research. I think that there might well be given more encouragement and facilities for the pursuit of research at our colleges, and that would interfere with nobody.

13994. Are there any other points you wish to mention?—If I may be allowed, I should like to make a reference to the examination for the National Diploma of Agriculture.

13995. As you are one of the examiners, perhaps that is only reasonable?—If I were asked my opinion generally, I should say of course that this is an examination which is capable of improvement, like everything else, but that it is an excellent examination as it stands. All sorts of remarks have been made depreciative of it, and as I have been connected with it from the very beginning, I should like, preferably by way of answer to questions put to me, to state what I think of the different objections that have been put forward to it. If I may single out any particular attack upon that examination, I would like to take the remarks of Mr. Hall in a Paper read by him recently at the Farmers' Club.

13996. Do you think that the examination is a sufficient test of the scientific and technical attainments of the students?—By itself not.

13997. You think it is not?—I think that it is an excellent general test, but I do not hold that any examination by itself alone is an indication of a man's abilities. I hold that as an examination *qua* examination it is the best of its kind that you can have, but personally I am not in favour of the examination system as an all-prevailing one—as ruling everything. With that limitation I consider it an excellent one, and the best thing of its kind at the present time.

13998. Do you think the results of class work should be combined with it?—I think that is already done. I think the Board of Agriculture, by helping the colleges, provides for that work, and that the examination as an outside and independent test coming on the top of it does provide what is required, but I would not have the National Diploma of Agriculture stand purely by itself as indicating that a man who can pass that must thereby necessarily be a good agriculturist. I hold that the two things should go together. On the one hand I should not be satisfied with the college examination alone, nor on the other hand should I be satisfied with the independent examination alone. I think that the concurrence of the two things is a very wise arrangement, and provides a very satisfactory test. There is no question that attacks have been made on this examination; they have been made in public, and I would like an opportunity of answering them.

13999. (*By Lord Moreton.*) Would it meet with your approval if in the future it was found possible to make the examination you have been referring to of a more directly practical nature, perhaps not so much as regards your own subject but as regards agriculture, and, say,

Dr. J. A.
Voelcker.

4 July, 1907.

botany and entomology. In other words, would you approve of the idea of a pupil being taken out on the college or other farm for a walk with the examiner, and put through his paces out of doors with regard to practical questions in a practical manner, by a practical man on a practical farm, and on any other kindred science that may be applicable?—I do not think this is called for in an examination such as that for the National Diploma of Agriculture.

14000. I did not ask you whether you thought it was called for, if I may say so. I asked you whether you thought it would be an improvement?—I do not think that it would be an improvement. I think that work should be provided for at the colleges.

14001. (*By Professor Middleton.*) For what purpose does the National Diploma examination exist?—I consider it exists as a test of the teaching at the colleges, and of the efficiency of the students there.

14002. Do you consider that the test is required?—Yes, I do think it is required, inasmuch as I do not consider that a college by itself, constituted in a particular part of the country where a particular class of agriculture is pursued, is a fair general all-round test, and I am always in favour of an independent examination rather than of one by a man's own teachers.

14003. You are in favour of an outside examination?—I am in favour of an outside examination.

14004. As compared with an examination by an institution responsible for the teaching?—Yes.

14005. Of course, that raises a very wide question which is constantly being debated in educational circles?—Quite so, and it is in that capacity that myself and others act for different colleges—Cirencester, for instance.

14006. I understood you to make two complaints against the colleges. One was the complaint that the colleges spent too much time in teaching practical chemistry instead of agriculture—i.e., that instead of training agriculturists they were training agricultural chemists?—Yes, I think that is an objection.

14007. Would you not agree that it is necessary you should train experts as chemists and agricultural botanists?—I do not think it is a thing on which public money or money given for educational purposes ought to be expended, and for this reason: that while you are doing it you are altogether killing the institutions which are not so helped, and you are also putting an unjustifiable bar in the way of outside professional men; in other words, you are cutting the ground from under their feet.

14008. So that you would have the higher education of the agricultural chemist and of the agricultural botanist entirely carried out at private institutions?—Yes, and for this reason: that for a man to become a properly qualified scientific chemist he needs to go through general chemistry in a very much closer and more minute way than if he is only using it for the purpose of getting some acquaintance with agricultural chemistry. In other words, an agricultural college, avowedly, is not a place where a man can get the requisite training in agricultural chemistry which is ever to make him subsequently a properly trained man, scientifically.

14009. I am afraid, if your argument were carried to a conclusion, it would abolish universities as training grounds for agricultural chemists and botanists?—No. I say that an agricultural college is not in a position to give the scientific training which will qualify a man for being a practical chemist afterwards.

14010. (*By Lord Barnard.*) You have twice used the word agricultural college. You see all those that we call collegiate centres marked on that map. There are many of those, Leeds, Newcastle Cambridge, Bangor, and the rest of them, which are not exclusively agricultural colleges. Do you apply the term agricultural college to these places?—I am afraid I used it rather too loosely; I am excluding those of University rank.

14011. (*By Professor Middleton.*) That relieves my mind to some extent?—I mean to say, if I may give an instance, a place like Wye College, which is an agricultural college, is, in my view, a totally different thing to such a place as Leeds University or Cambridge University, where a man can pursue his distinctly scientific training, independently of what he is going to do afterwards, whereas at Wye he only gets enough science to enable him to dabble in analysis afterwards.

14012. You agree that a university college is the right place to train scientific experts?—Certainly I do.

14013. You hold strongly that a college should not undertake chemical work?—Strongly.

14014. That is to say that a chemist attached to a college should not take such work as is undertaken by the County Analyst under the Fertilisers and Feeding-stuffs Act?—I do.

14015. Personally I agree with you, but I am bound to say we have had instances before us where we found that the colleges were able to take up this type of work with great benefit to the agricultural community; the argument which was used by the college was, that by doing this class of work they brought themselves into closer relation with the farmer than they could possibly have done if this particular type of work had been neglected. Do you agree that there is something to be said from the point of view of the College?—I say there is nothing whatever to be said in defence of their taking up work which is not work of agricultural education. In other words, I do not hold that it is agricultural education; it is doing for the farmer what he can get without educating himself, and I think we are going out of the province for which we have received public money, and in the meantime I think it is destroying the pursuit of agricultural chemistry as a practical science.

14016. Not the pursuit of agricultural chemistry. I should say rather the business of analytical chemistry?—It is destroying it, and it is destroying the coming forward of any man to work outside any of these institutions; it is destroying it as a profession, practically. The ground, in other words, is cut away from under the feet of competent men who are engaged in agricultural work and outside people who pursue agricultural chemistry as a profession. The ground is cut from under their feet by the system of low fees practised by agricultural colleges. I have cases before me now which would illustrate what I mean, if it were wished.

14017. I agree to a very large extent with the point of view you take up, but with some of your remarks I cannot agree. Is it possible that this work is being done by men who are incompetent and who are not properly trained?—It is perfectly well-known that there are at Colleges perfectly competent men; but it is also thoroughly well-known that these men cannot do the analyses themselves, and that they have to leave it to be done by their students.

14018. I am surprised to hear that?—And if a man who is a director of a department has to do the analyses himself for these miserably small fees, I say it is a waste of his time and of his talents to do such work and to take it away from other men who have to live by their knowledge; in many cases it is done by students who have a certain scientific knowledge, but who were never intended to have the special knowledge necessary to carry out such work. I do not say in all cases the work is done by students, because very often the director of a department employs a man to do it who, though by no means necessarily, is a Fellow of the Institute of Chemistry.

14019. (*By Lord Barnard.*) Without pursuing the subject any further, I think I clearly understand you to say, no doubt speaking for other members of your profession?—Yes.

14020. That you have the strongest objection to colleges which are provided for agricultural instruction being indirectly used for doing the work which you consider your profession ought to do?—You have exactly expressed it, my lord.

14021. (*By Mr. Latham.*) With regard to these remarks that come, I suppose, absolutely from your professional life, may we take it that a large amount of the analyses that are done in these agricultural colleges would barely stand if a certificate had to be given?—No. They do not command the respect and confidence of the trade even. I mean to say when any question arises they cannot be used and they do not command confidence.

14022. (*By Professor Middleton.*) When any legal question arises?—Yes, when any legal question arises; and I have had, over and over again, in my experience, instances of discrepancies between their analyses and my own and others.

14023. (*By Mr. Latham.*) I suppose we may take it for granted there are always those discrepancies between two analyses?—Unfortunately there are.

14024. Are they not far enough advanced to give certain evidence of what is going on in the agricultural

Dr. J. A.
Voelcker.

4 July, 1907.

world?—I felt it necessary, if I had the opportunity, to give expression to these views because undoubtedly encouragement is given by the Board of Agriculture to the fixing of appointments under public Acts such as the Fertilisers and Feeding Stuffs Act in agricultural colleges, and the Institute of Chemistry wishes distinctly to protest against it. In many cases already the appointments are held by men who are teachers in agricultural colleges and who are at the same time agricultural analysts under the Fertilisers and Feeding Stuffs Act.

14025. (*By Professor Middleton.*) May I point out, as a matter of fact, that the local authorities appoint these analysts?—Yes, but they cannot appoint them without the approval of the Board of Agriculture.

14026. The Board of Agriculture cannot object so long as the analyst is a properly qualified man and approved of by the local authority?—My point is this: that at the head of the Department may be put a man who is a qualified chemist, and if that man is free to take outside work he has also to do these analyses for the farmers, and his time, in my opinion, is wrongly used in doing analyses at ridiculously low fees aided by public money given for educational purposes. If he does not do them himself, there is no control whatever as to the competency of the man whom he employs to do it for him. In other words, he gets somebody else to do it—it may be his assistant—and the Institute of Chemistry has no control over those men, and there is no test whatever of their competency.

14027. (*By Lord Barnard.*) He puts his name to it?—He puts his name to it—I have some of them here before me.

14028. (*By Professor Middleton.*) Does not every analyst employ assistants, and must not he make himself responsible for the work of his assistants?—Yes. He makes himself responsible for it just in the same way that I do for the members of the Royal Agricultural Society; but everything goes through my own hands. The point I make is this, that you are receiving money for agricultural education purposes, and I do not consider that making analyses for farmers is education at all. This point has been introduced by me, if I may put it so, on the ground that this is not what is intended by agricultural education.

14029. That is quite apart from the competence of the men who undertake the work?—Yes, but I think it is within the scope of the Committee.

14030. (*By Lord Barnard.*) We have discussed on many occasions the meaning of the term education, and we have come to the conclusion that we must not accept it in the sense of teaching little boys or little girls by way of training their minds, but that it is distinctly technical and scientific, and I think the line we shall take probably will be, as long as these analyses which you have mentioned are used for the purpose of obtaining information and instructing the farming classes, that they are justifiable, but I do not think it is done, or at any rate not largely done, for purely commercial purposes?—Not for purely commercial purposes.

14031. (*By Mr. Latham.*) Do you wish us to understand that there are different grades of analysts?—Yes, certainly.

14032. That some men are not as competent to give a full analysis as others?—In analyses there are two sides, as it were. There is the purely mechanical side, and there is the other side, the interpretation of the results. The purely mechanical side can be done by a man without any scientific training—a man that one generally calls an assistant. An assistant may have simply practised in that branch and he may make as competent or a more competent analyst than many men who stand high in the profession, but that is the mechanical side, but when you go on to speak of the interpretation of an analysis, and what it means, then I say that nobody ought to undertake that part unless

he has had from the beginning a distinctly scientific training, and the subsequent application of that training to agriculture in particular.

14033. You hold the opinion that, unless a man belonged to your body, it would be very difficult for him to carry out this work?—I cannot go so far as that, but I do say it is the endeavour of our body to make sure that the training of all men who shall figure as professional chemists subsequently, and fill public appointments, shall be according to the curriculum that we have laid down, which implies practically three years at a university or a collegiate institution, followed by a certain number of years practical acquaintance with a man engaged in that particular subject.

14034. How are public bodies such as county councils to find out that these chemists who are described in this book, and who are, as I should have thought, properly educated men, are not analysts according to the views that you hold yourself?—We are constantly trying to press upon public bodies, such as the Board of Agriculture and the Local Government Board, the importance of only sanctioning the appointments being given to men belonging to our institute.

14035. I thought possibly that would be your answer: that you would throw it on the Board of Agriculture that they should not accept these men unless they were members of your body?—No.

14036. But they do?—Now it is getting understood, and it would be only fair of me to say that both those bodies are more and more recognising the need of it.

14037. There is no fear of a county council appointing such a person as you described as—you will not say fully-equipped, but one who does not belong to your profession—to take up the line that you yourself follow?—There is not the danger now that there was previously; but what I would like to point out is the difficulty of the position in which many of our fully-qualified men find themselves, whether they like it or not. It is that, being qualified men, they have such an appointment given them when engaged at a college, and when they are once there they have to do what they are told, so that they have to do cheap analyses for farmers, and they may have to do chemical work for people outside or run the risk of losing their appointment. They have to do it. It is not competent for a man to say, "I will not do it," unless he can influence his council to prevent him taking such work. Many of our qualified men, as, e.g., in Newcastle, do not wish to do it, and are thoroughly with us on that point; but they are not in a position to quarrel with their bread and butter; they have to do it because their county councils oblige them to.

14038. May I put it in another way. Independently of the Fertilisers and Feeding-stuffs Act, is there any very serious objection to their taking up the analysis of certain farmers' goods which are not likely to go further than just to assist the farmers?—I think so. I consider that work was very well done by agricultural societies all through the country, and these agricultural societies made a point of having attached to them thoroughly qualified men who thereby made a living by it, but now the ground is cut from under their feet. They cannot compete with the agricultural colleges charging half-a-crown for a soil analysis. Those are the points we complain of at the present time. Some agricultural colleges are doing complete analyses of soil at 2s. 6d. that I myself charge five guineas for.

14039. You are a trade unionist?—It is absolutely necessary if you are going to have any extension in the direction of agricultural chemical work and research work that you should give a man a fair living for his work, and that in the case of our men in colleges you should not hamper their work by making them give up their time to doing half-crown analyses. How can a man do his work of agricultural education, teaching his students all the time, if, whenever a farmer sends him in a complete analysis of soil, he has to do it for 2s. 6d.? How is that going to be done; and is that agricultural education? I say, no.

MR. GEORGE HOGBEN, M.A., called and examined.

14040. (*By Lord Barnard.*) You are Inspector-General of Schools in New Zealand?—Yes, that is the legal title of the head of the Education Department.

14041. Your Department covers both primary and secondary schools?—The Education Department of New Zealand takes cognisance of every grade of education; it differs from those of the Australian States in that respect.

14042. Does the State undertake any duties in connection with the instruction of agriculturists?—Nearly everything that the State does is done through local bodies of one kind or another; the control is not direct as in Australia.

14043. Do those local bodies undertake any special duties in connection with agricultural education?—Yes, the State encourages agricultural education from the elementary school up to the University, in fact further than the ordinary degree, up to the research stage, by grants which are given or offered under certain conditions.

14044. Those grants are given specially for agricultural work?—Yes, some are, and of course there are others that are not given specially for agricultural work, but which can be used just as much for agriculture as for other branches of applied science.

14045. Elementary schools I see you call primary schools?—I call them primary schools for convenience, because the words "secondary schools" are used. The divisions of schools in New Zealand are not exactly the same, necessarily, as they are in England. The primary school education goes one class further than the compulsory stage. That is what we call primary education. University education, I think, is pretty generally understood as being parallel to that in England, and anything of an intermediate character we are gradually getting into the way of calling secondary education. A part of the technical education is secondary, and a part of it is of higher rank, that is to say, of University rank.

14046. What is the Department that controls education?—The Department of Education.

14047. Have you a Department of Agriculture?—Yes, but that deals more indirectly with educational matters. The Department of Education acts in concert with them, but agricultural education is not under their control.

14048. Your department consult them, do you?—Yes, we consult them, and they give us certain facilities; they also conduct the experimental farms; the experimental stations are under the Department of Agriculture.

14049. I suppose you will agree from your own experience, after what you have just said, that this kind of work, obtaining information, and diffusing instruction and knowledge to agriculturists, is rather on the border line between the two departments—the Department of Education and the Department of Agriculture?—I think so, but I think when it is dealing with the diffusion of literature among farmers it is better carried out by the Agricultural Department as we have it, but when it is distinctly dealing with technical institutions it is better done by our Department, as we want to keep a co-ordinated system. We are extremely anxious to do that in New Zealand, and we have succeeded in getting a degree of co-ordination that we have never had before. We do not want to cut off agricultural education from the system that is adopted with regard to other education; the elementary schools cannot be handed over to the Agricultural Department, and the secondary schools cannot be handed over to them, nor the University. We deal with all those.

14050. The practical, or demonstration, part of the work is done by the Agricultural Department?—Yes, except the work that is done in the Agricultural College.

14051. In your primary schools there is a certain amount of teaching given in agricultural subjects?—Yes, that is of two kinds. First of all, what is not specifically agriculture at all comes under the head of nature study. We are very strong believers in nature study in New Zealand, and we do not find any disadvantages from it. We do not believe in it as an isolated study. We believe that it should go through all the work in the elementary school—right through the work. I mean to say we require from certain schools definite courses of nature study. Every school with more than one teacher must have a definite course of nature study; but every school without

exception must take nature-study, even the schools that have only one teacher, and it must be held in view in all the lessons. The principal objects of that nature study are to train the children in observing the things around them. That is the most valuable preliminary training, in our opinion, either for agriculture or for anything else.

14052. That training is not specially limited to agriculture?—No, but without it higher agricultural education would have to begin by teaching things that the pupils ought to have learnt ten years before.

14053. Do you have any school gardens in connection with your schools?—Yes, I was going on to say there was the general course of nature study for which our primary school syllabus gives suggestions. Then there is a suggested course of elementary science for town schools, and another for country schools, although it is not limited to country schools; it might be called an extended course of nature study bearing very closely on agriculture. We give that to every one, whether they are going to be farmers or not. We are not so much afraid as they are in some countries of specialisation, as we think you can get just as much scientific training by taking subjects that come under the head of agriculture in the elementary stage as you can by taking the subjects that come under any other head. It is the method which should be scientific, not so much the subject matter. That is our point of view, and we say we can give the boys and the girls—because we treat them all alike in that respect—a general elementary training in a scientific method by taking the subjects that are called agricultural as by the subjects that are allied to any other branch of life. Observation of that policy where it has been worked leads inspectors all over the country to say that it is capable of giving to country children a general training in elementary scientific method that you could not get in other ways.

14054. Is the bulk of the population of New Zealand agricultural?—Yes, more than half is agricultural. The proportion of male workers is about four to three; that is, four out of seven, or perhaps not so many. Perhaps eight out of 15 would be employed in agriculture directly or indirectly, not counting merchants therein, and the others would be employed in all the other industries.

14055. So that that would be a very strong reason for making elementary agricultural science the most prominent of all?—We encourage it in the towns too at the present time. We hope in that way, and we think we have succeeded to a certain extent, in counteracting any tendency to congregate in the towns. We find now a good many going from the towns into the country. They thereby acquire a liking, or we think they acquire a liking, for country subjects, because they are taught to observe natural objects even although they belong to town schools. We think that it would be unhealthy to allow the sort of thing to grow up that, unfortunately, circumstances have created in other places. We have seen the beginnings of it, and our problem is simple, and we think it would be wrong for us if we did not solve the problem while it is simple, and we are trying to solve it in that way. So that there are town schools that have exceedingly good classes in agricultural subjects and school gardens. I may say that some of the best school gardens are in the neighbourhood of towns or in towns; sometimes town schools actually take land outside the town in order to have a school garden.

14056. Is that all you have to say about the elementary schools?—We pay grants to encourage the school gardens for what are called recognised classes under the Manual Instruction Act, whether in primary, or technical, or secondary schools. We pay 10s. a head the first year up to £7 10s. for each school—we pay a grant sufficient to meet the whole cost of the apparatus—that is practically what it is. Then we pay a maintenance grant after the first year—that is to all these schools—in addition to what we pay for the free places in secondary schools. Two-thirds to five-sixths of our pupils in secondary schools are now holding free places. There is no poverty clause, and so it applies to practically the whole population. If boys or girls reach a certain qualification they can get a free place. Those free places are tenable either in secondary schools proper or in district high schools (that is, primary schools with a secondary department attached), or in technical schools. The examination for those free places

Mr. G.
Hogben, M.A.

—

Mr. G.
Hogben, M.A.
—
4 July, 1907.
—

is in two series—junior free places and senior free places. The junior free places are for boys or girls up to the age of 16, and before the age of 17 they can pass the senior free place examination, and can get senior free places up to the age of 19; and this also applies without limit of age, but limited to three years, in the case of senior technical scholarships. The important point with regard to the examination is that it includes among the subjects elementary practical agriculture, so it encourages them while they are holders of junior free places to take a subject which will count as much as any other science subject. They are encouraged to take that subject, and it has to be taken in connection with practical work in the laboratory and practical work in the school garden. Half the time must be devoted to individual practical work.

14057. Do you give any special instruction in the way of preparing them for other industries? Supposing a boy intended to become a seafaring man, would he get a course of agricultural instruction if he was going to take to the sea for a livelihood?—Are you speaking of the elementary and secondary schools?

14058. Yes.—Most of our people live in the country. If a boy or a girl is going to be taught elementary scientific method, even if the boy is going to be a sailor, it is no use taking him away to an environment with which he is not familiar. You must teach him elementary scientific method from the things that he is familiar with, and that he sees round about him.

14059. The only thing that occurs to me is that a seafaring man would see so little of those things when he was at sea?—You cannot teach a child elementary scientific method except from the things that are around him. So that even if a country boy is going to be a sailor, you cannot train him except from the things that his mind has been in contact with already in his own district.

14060. The class of boys who go to sea in this country, are generally boys who live in the towns or along the sea coast?—Then the nature study, if they live by the sea, would naturally relate to things concerning the sea, things with which they are familiar. It ought to relate to the things they are familiar with. That is our feeling at least. If you try to teach a boy scientific method by things with which he is not familiar, he will fail, because his mind is not prepared for it at all. That is the position we have taken up in framing our classes. Of course there are schools on the seaboard where they take nature study, they would study, naturally, things that are akin to the sea life. Our sea population is not such an important proportion of our population as our rural population.

14061. You have some classes for teachers in a great many districts?—Yes.

14062. Some of those classes are itinerant, I understand?—Yes; we have classes for teachers in nearly every district.

14063. I am talking only of agriculture?—Yes; I mean in agriculture. There are 13 divisions (called Education Districts), and in 1905 there were agricultural classes for teachers in eight of those, and I think there are this year agricultural classes for teachers in eleven or twelve out of the thirteen.

14064. Are they compelled to attend, or is their attendance voluntary?—It differs according to the Education Board of the district. It cannot be said to be compulsory in the strict sense of the word; but there are Boards who have given their teachers to understand that if they wish for promotion they must attend these classes, and that has produced the same effect.

14065. Do teachers attend these classes largely?—Yes; they are generally very popular.

14066. How long do the classes last, a day, a week, or what?—The classes generally last for about six months; they are held once a week for six months. Some of the classes take three or four hours on Saturday mornings; that is to say on Saturday mornings there would be two or three classes, and two hours' practical work; they are generally carried on by specialists.

14067. Do they teach such subjects as chemistry, geology, botany, and so on, in the teachers' classes?—These teachers' classes which are held by the Boards are not the only classes for teachers; because there are four university colleges, and several of the university colleges carry on work of a higher kind for teachers.

14068. I wanted rather to ascertain from you what the teachers were taught in these classes generally—the

nature of the instruction?—They are not all alike in any given year. There is a general resemblance in the complete course. They generally go on for several years. There is generally one good course of practical botany. Some of them contain courses of chemistry, and some of them do not. I am speaking only of the classes for teachers held by the Education Boards. Most of them, have contained, and in future probably all will include courses in elementary practical agriculture, more advanced than that done in primary schools; in fact the classes are intended to bring the teachers who have not in the past had an opportunity of receiving proper training, up to such a point that they can carry the pupils on, so that we shall not have to wait till the next generation of teachers comes; in the training colleges we are preparing the next generation of teachers.

14069. They take a course of nature study and also a course of elementary practical agriculture?—They do—that is, the students in the training colleges do so—and practically they must, take a course of science at the University College. We are bringing up their work a stage higher, more to the university rank, that is, the teachers that are to come; but the teachers who have already qualified in other respects we are trying to bring up to the minimum.

14070. When you speak of university rank are you referring to a State college?—Nearly all our institutions, in one sense, are State institutions.

14071. Is the College founded and maintained by the state?—It is maintained by revenues derived from a Crown grant of land; a grant of land was made by the Canterbury Association.

14072. I only wanted to ascertain whether it was private or public?—They are all public, in that sense, in New Zealand.

14073. I mean, maintained by public funds?—Yes, funds derived from a Crown grant.

14074. The College grants a diploma, I suppose?—The College grants a certificate, but not the degree of Bachelor of Agriculture; that is granted by the University of New Zealand. That is the only degree-granting body in New Zealand.

14075. What is the class of people who go to the Agricultural College—teachers or agriculturists?—The The majority of them are going to be agriculturists.

14076. Both sexes?—No, only men. There are some that are not matriculated students at the College. I could not give you the exact numbers, but it is probable that the majority are not matriculated. If they have matriculated, and desire to go on for the Bachelor of Agriculture, their course at the Agricultural College is recognised as part of the course for the Bachelor of Agriculture degree.

14077. The farm is not under your department, is it?—No, except that our scholarships would be tenable there. We grant scholarships and free places. We granted 550 scholarships this year, and about 6,000 free places, but, of course, those are not all for agriculture; only a few are so held.

14078. They are given to anybody who asks for them?—They are free to anybody who asks for them, if they show that they are qualified for a free place. Qualification means a good certificate of proficiency in the sixth standard, or the passing of the special departmental examination under 14. In the former case they must have passed the sixth standard under 14, the other examination is without limit of age.

14079. You also mentioned that you offer scholarships for the University?—Yes, the free places at the University, and the scholarships at the University are granted in the same way.

14080. With regard to the men who are actually farming the land, they have all been to an elementary school, of course?—Yes.

14081. Have most of them been to a secondary school, do you think?—No, not most of the older farmers, but now a very considerable portion of the population will either go to a secondary school or else to a technical school; I include the agriculturists.

14082. A few, of course, go to this Agricultural College of which you have told us?—Yes, there are not so many students there. I think that is capable of expansion, but the proportion there—you ask me what was the fact—is too great in my opinion of those who are going to be farmers. I think it should occupy a distinctly university position, and that the classes we are getting up all over

the country, in an organised form, should be for farmers' sons.

14083. Do the ordinary working farmers possess an elementary knowledge of science, or do you hope the rising generation will?—Yes, a knowledge of scientific method, and an understanding of the things about them, most distinctly. Practically, every holder of a secondary free place must take a science, and we are encouraging agricultural courses as much as ever we can. In every case we are giving the highest grants for that, and the probability is that a large number of schools will take that up. Last year I went through the majority of the secondary schools in the Colony, and in the country secondary schools there is a very large disposition to encourage the future farmer to take up this work, in fact, to insist almost that he shall take up this work, and you might say a very considerable proportion of those in the country secondary schools at the present time are going to be farmers—probably half of them.

14084. (*By Professor Middleton.*) Could you give us some idea of the syllabus of this elementary practical agriculture?—I will send you one—it does not include the higher parts of agriculture.*

14085. I am especially interested in this first subject—elementary practical agriculture—which you say is of such high educational value?—I think so.

14086. The value of which is so great apparently that you would even adopt it in schools in towns?—Yes, I do not say in all—some of them. We put the real educational value of it very high.

14087. You have definitely noticed that the effect of teaching this subject in schools in towns has been to check rural depopulation?—It is a difficult thing exactly to say what is checking the depopulation or increasing the rural population. There are so many things that enter into it; our land policy may have something to do with it, to some extent.

14088. But you do think this instruction you give really has something to do with it?—Yes, we think it has something to do with it, but to say definitely it had would be rather difficult.

14089. You have, at any rate, an impression that it is doing something towards it?—Yes, we feel that it is doing something towards it. I should like to add that this programme of elementary practical agriculture is also included as one of the subjects which a teacher may take for his Certificate, so that we encourage the teachers to take it; they can drop one other subject if they take that.

14090. Roughly, what is the age of the boys who would be taking this subject?—The average age would be 12 to 16.

14091. You expressed the opinion that too large a proportion of the students attending the Agricultural College belong to the class that were going back to the land?—It depends on what agricultural college means. The Agricultural College at the present time is serving two functions, one is, that it is the College that is recognised by the University as a College where a certain portion of the agricultural education may be received to qualify for a Bachelor of Agriculture. The Bachelor of Agriculture is a degree that is as hard to get as an ordinary B.A.—rather harder possibly, but there must be a college at which the specific technical instruction can be given, and the Lincoln Agricultural College is recognised for that purpose. It was originally instituted, some 30 years ago, as a college for the sons of farmers, and it is only because of the *personnel* of the staff that it is now wavering between the two. The personal qualifications of some of the men are very high, and it is really the *personnel* that led the University to recognise the College.

14092. Your opinion is, that in this particular College you ought to pay more attention to subjects of university rank and less attention to the lower grade subjects which would be required by a man who was going back to the land?—That agrees with the general policy of technical education in the Colony. I think there should be a great many local institutions to train farmers; but we think one central institution of the highest grade is quite enough.

14093. I may take it that it is to train experts and teachers and so on?—Yes, experts and teachers. Of course they may go on to farming, but we should not train them with that idea. We train them with the idea that they

are to be the actual leaders of the agricultural industry, either as teachers or in some similar way.

14094. (*By Mr. Latham.*) I think I understood you to say you did not know much about the State farms?—They are not in our department, but I have seen them.

14095. You cannot give us any information about them?—My information would be meagre. It would be that of an outsider except that when I wanted to see if our scholarships should be held there I satisfied myself with regard to them and came to the conclusion that they ought to be held there.

14096. Why I ask is because you say students who are likely to profit by them are allowed to attend for a time free. What time would that be?—Our free places are tenable there, and a research scholarship would be tenable there—that would be tenable for two or three years if necessary. Generally speaking, the time students would spend on the experimental farm would be six months. It would depend on what kind of farm it was. The experimental farms do not exist for the purpose of education; they exist as research stations.

14097. Is all the teaching that is given at the farms free?—There are no definite courses of teaching at the farm. There is a definite course of research going on.

14098. Perhaps I have used the wrong word. Is all the education they can get there free?—Yes, they will not have to pay anything, that is to say, if they are our students, but all our education is very nearly free, from top to bottom.

14099. I may take it that the whole of the education in New Zealand is free?—If a person does not qualify for a free place he has to pay, and there are a certain number who pay because they do not qualify for free places; but that is a smaller and smaller number.

14100. You say there is an agricultural college of the university rank and a dairy school of the same standard about to be established?—Yes, we have several dairy schools, but there is not one already established of university rank; there is one to be established of university rank. The Government has announced it.

14101. Do you think it is necessary to have a dairy school of such a high standard?—Yes, you want one central school. That of course is to train the instructors, and you want a good many others of lower standing.

14102. That is more for giving instruction to teachers?—For teachers and also for managers of big dairy factories; it is very important that managers of dairy factories should be well trained.

14103. (*By Mr. Davies.*) You told us about the training of all teachers in nature study. Is that compulsory?—The teachers that are going through the training college?

14104. Yes.—Yes, every teacher must take a course of nature study, even if he is going in for a degree.

14105. With regard to the teaching of nature study in all your elementary schools, has that been going on for a long time?—No, I cannot say that these arrangements have been going on for very long. The definite adoption of them in the programme is not more than eight years old, that is to say the compulsory adoption.

14106. So that you have hardly had time yet to be able to say exactly what the results will be?—Not of making it compulsory. Of course it was done before, but it was done in individual schools where the teachers did it on their own initiative. Of course nature study did not begin eight years ago. It began a good deal before that in a great many schools, but it has been made compulsory since then.

14107. You told Professor Middleton that you hoped that this policy would help to keep people on the land, and would do something to prevent the localisation of people together in large industrial centres?—Yes.

14108. This policy had been in operation for eight years, has it not?—Yes.

14109. So that it is rather early yet to see the results and that is why you cannot express any very definite opinion?—That is one of the reasons, of course; but a great many of those who take up land are only 18 years old, and if they were 14 or 15 when they begin to take up the subject some of them may have come under the influence.

14110. Do you find the agricultural classes in New Zealand are really beginning to realise the benefit of

Mr. G.
Hogben, M.A.
4 July, 1907.

* The witness subsequently forwarded a copy of the syllabus referred to.

Mr. G.
Hogben, M.A.
4 July, 1907.

agricultural education—I mean as it affects their own particular industry?—There are two classes of farmers—the farmers who do not seem yet to have appreciated the importance of it, and the farmers who appreciate it so much that they are urging the Government to do even more. There seem to be those two distinct classes. During the last two years the number of those farmers who take a very keen interest in that is increasing largely, and I think that almost every agricultural association and farmers' union has passed strong resolutions in favour of it, and a good many of them have subscribed money towards the formation of associations for carrying out the instruction.

14111. I think one of the features of your education system is that education is so very cheap as compared with other countries?—By cheap, you mean to the person that is benefited?

14112. Yes.—Yes, it is mostly free.

14113. Do you find that the people, especially farmers, appreciate it more than before?—Yes, they appreciate it ever so much more than before.

14114. They take advantage of the opportunities now presented to them?—Yes; it has doubled the number in the secondary schools. There is ever so much more interest. We know nothing of the idea that some people have, that if people do not pay for education they take less interest in it. The whole population now regard it practically as a disgrace if they do not go as far in education as they can. The effect of the free-place system has been to educate them up to the importance of education; they all know that they are paying for it through the taxes. They realise that, and it certainly has an educative value on the parents as well as on the children.

14115. You told the Committee about the Agricultural College. Is the Agricultural College isolated by itself, or is it a department of the University College?—It was once a department of the University College, but it now has a separate board of governors. The University of New Zealand recognises it as an affiliated institution, but it has its own government.

14116. Do you not think it is advantageous that a university should have an agricultural department so that the students in that department might mix with the other students in the university who are attending other departments, and in order that they might at the same time utilise the chemical and other laboratories which are part of the university buildings?—I believe that is the best arrangement, that is to say, for one of university rank; our students for the degree of Bachelor of Agriculture do take two years out of the four at the University College, with other students.

14117. If you were going to build a new agricultural college you would build it as part of the university?—I should advise the Government to do that, yes.

14118. Do you give any instruction in manual work as affecting agriculture?—Manual work is used in rather a narrow sense in England. Manual work in New Zealand includes science, where the science is applied practically.

You mean manual work as it is understood in England—woodwork and ironwork, and things of that kind?

14119. Manual work relating to agriculture, more especially in draining, hedging, gardening, digging, pruning trees, and that sort of thing?—In the course for our elementary practical agriculture it is stipulated that half the time must be given to practical work, and that includes manual work. The children must work the gardens, and do all those things.

14120. In the elementary and secondary schools?—Yes, it does not matter where—in the secondary schools where they take the subject.

14121. Have you any agricultural circulating libraries in different parts of the country?—Special agricultural libraries?

14122. Yes.—Several of the agricultural societies have. I know one or two have. I do not know how many. There are no Government ones; the Government subsidises public libraries, but does not say what books shall be put into them.

14123. Do you think that would probably be a good thing?—Yes, I think it would be a very good thing indeed.

14124. So as to keep students after they have left the College still in touch with their books?—Yes, I think that would be one means, and I think itinerant lectures would be another means. Our regulations provide for subsidising itinerant lectures.

14125. With regard to the experimental stations, is there any board of management directing the experiments which are carried on at those stations, and the research work which is done there?—The Agricultural Department is doing that.

14126. These experimental stations in different parts of the country are under the supervision and control of the Agricultural Department?—Yes.

14127. The Agricultural Department co-ordinates the results of all the experiments?—Yes, it has experts of its own, and the results are co-ordinated and published.

14128. How do they publish the results?—The results are published in several ways. When the area of investigation is a narrow one, the results are published tolerably soon in the form of leaflets, but when it is a wider one, it takes a longer time before they are published perhaps, and then they are published in a full Government report; but even the leaflets are summed up in the annual Government report. The Department of Agriculture has a good many sub-divisions like our Department—for instance, veterinary science. I have not touched on that at all. We are very strong in the support we give to veterinary science. It is so important from our dairying point of view; a great deal of attention is paid to it, and pamphlets are constantly being published on the subject. They are, I consider, fully educational, though our Department does not deal with that. Wherever there are classes or institutions our Department deals with them by subsidising them. That is where our Department comes in; and as regards the spreading of literature for farmers the Agricultural Department does that, and it pays the whole cost of the experimental farms.

TWENTY-SEVENTH DAY.

Wednesday, 10th July, 1907.

PRESENT :

The Lord BARNARD (*in the Chair*).

Mr. DAVID DAVIES, M.P.
Mr. F. D. ACLAND, M.P.
Mr. NORMAN LAMONT, M.P.
Mr. THOMAS LATHAM.

Mr. J. C. MEDD.
Professor T. H. MIDDLETON, M.A., M.Sc.
Mr. A. E. BROOKE-HUNT (*Secretary*).
Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. E. S. BEAVEN, called and examined.

14129. (*By Lord Barnard*). You know, I dare say, the objects this Committee have in view, to enquire into the existing facilities for affording scientific and technical instruction in agriculture, and to report whether those facilities are satisfactory and sufficient?—I do. I have stated to the Secretary that with regard to instruction I am afraid I have no facts to place before this Committee, and I am somewhat doubtful as to whether the evidence I have submitted a *précis* of is within your scope. It applies to the advantages of research in a special subject.

14130. I have had the advantage of reading the *précis* which you have given, and it is my opinion, and I dare say that of the Committee also, that we shall be very glad to hear your opinions. You are a maltster, I think, and have been for a good many years?—Yes.

14131. I see from these printed publications that I have in my hand that you have for years past taken a very active and unusually intelligent interest in the application of technical knowledge to the improvement of barley. The object of that is, as you say in your *précis*, to improve both the yield and the quality?—That is the object in view.

14132. You have conducted a great number of experiments to that end?—I have.

14133. What is the present attitude of the malting industry on the subject?—That is an extremely complex matter, and I should take up a good deal of the time of the Committee if I were to attempt to go into that in detail.

14134. Will you give us some information with regard to what you say in Paragraph 2 of your *précis*?—It has become recognised of late years in the malting industry, as in the case of milling, that it is desirable to have more than merely empirical and practical knowledge of the grain which is used, and there has been a great extension of laboratory work in connection with the routine of these industries.

14135. You undertake a great deal of laboratory work yourself?—I have done a great deal.

14136. Of course such work would have a very important bearing upon agriculture and would be of great use to the practical agriculturist?—I think so. Speaking generally, it appears desirable to have all the knowledge that can be obtained as to the effect of conditions on the value of the produce.

14137. In giving them information as to the actual grain which they ought to grow?—That is so.

14138. With the object, as you have already told us, of improving both the quality and the yield?—Yes. I attach special importance, I may add, to experiments directed to the increase of the yield of barley, and more particularly with reference to the specific qualities of new varieties.

14139. You desire to illustrate that by reference to what has been done in the case of the beet sugar industry?—Yes. I think the fact that there has been such a great improvement in the composition of sugar beet as a con-

sequence of prolonged investigations, from the chemical and biological point of view, is an illustration of what might be done with other plants, and the introduction of improved sorts. I do not suggest that there is the same scope, or that there is the possibility of so great an improvement as has taken place with regard to sugar beet, but I think there is some considerable scope. I only refer to this as an illustration.

14140. It is within your knowledge that the improved varieties of beet which are now cultivated have practically been to a very large extent the result of scientific research?—Undoubtedly, as the result of prolonged and systematic investigations.

14141. You think that a similar process might be applied to barley in this country?—Yes. I am not hopeful of so great results in that direction. As a matter of fact very good barley is already grown in this country, and the problem with regard to barley is, perhaps, rather a question of improving the yield and still maintaining the quality.

14142. What is your experience of the facilities which exist in this country for such work?—This may be considered from two points of view: first as to original research on strictly scientific lines directed to agricultural problems. This has been and may continue to be carried on to some extent by private individuals; but, speaking generally, the resources of well-equipped and well-staffed institutions are desirable. Secondly, there is the work of field trials and demonstrations. I should say with regard to institutions in which research is carried on in this country that we are not well supplied with such institutions.

14143. As compared with foreign countries, for instance?—Well, as compared with Germany, I can give an illustration from my own experience. Some years ago I was anxious to obtain as complete a collection as possible of botanically distinct varieties of barley, with a view to more close study of their characters, and I found there was no such collection as that in this country. There is at Kew a collection of all kinds of plants, which no doubt are of great interest from a purely botanical point of view, but there was no institution in this country from which you could get anything like a complete collection of seed representing different varieties of agricultural plants, and I was obliged to depend almost wholly on foreign sources for the collection which I was able afterwards to make.

14144. What did you do?—The Board of Agriculture were good enough to give me a great deal of assistance in the matter, and I found that there were two German Professors, Drs. Kornicke and Werner, at the Landwirtschaftliche Akademie at Poppledorf, near Bonn, who had been studying grain to what may be called an encyclopædic extent, and they were the authors of a standard work, "Die Handbuch des Getreidebaues," which is practically the only standard work in existence at this moment on grain—on the different varieties of all

—

the cereals, and if one wants precise knowledge on that subject one goes to that text book. I found that they had been conducting researches for a great number of years at Popplesdorf, a very large and well-equipped institution; it was there that they had carried out the researches of what one may call almost a historic character, the results of which were embodied in their book. They were good enough to send me a complete set of seed from all their cultivations. A great many of them, of course, are of no practical value, but they are of considerable scientific value from the point of view of a study of the subject of variation in barley.

14145. In fact, you could get in Germany what you could not get in England?—Exactly.

14146. Do you know whether this institution at Popplesdorf is supported by the Government, or maintained by the Government?—I do not.

14147. There is no institution of that kind in this country, is there?—I should say there is no institution at all approaching it in extent.

14148. You think we ought to have such an institution?—I think so, but at the same time I would like to say that I think that the extent to which those kind of institutions have benefited German agriculture is a matter for inquiry. I have been at Popplesdorf, and I have seen that institution, and I know the kind of work that is carried on there. I believe it is one of many of a similar kind in Germany, but I spent a month last year in Germany, and on the whole one is not impressed with the idea, in North Germany at any rate, that we have very much to learn from the Germans as regards practical agriculture. My knowledge of German agriculture is, however, very limited.

14149. You do not suggest that we should slavishly copy such institutions. You think we might get some hints from them in improving our own?—Exactly, I think it is a subject which very much needs to be inquired into, as to the work which is being done by the many institutions of that kind in Germany, and how far it is of assistance to practical agriculturists.

14150. Is that all you have to say with regard to Germany?—Yes.

14151. You have also made some inquiries on the same subject, I understand, in Denmark?—I found that in Denmark they had given more attention to the particular subject which I was studying, as far as I could make out, than any other country—I mean from the practical point of view. What I have said with regard to Germany relates to the academic point of view rather, the existence of institutions where research and instruction has been carried on. In Denmark I found very excellent practical results had been obtained, largely through the operation of the Royal Agricultural Society of Denmark, and I came in contact with and had long correspondence with the officials of that Society, and I found that they had conducted their experimental researches in respect of barley—I am confining my evidence now entirely to that—on a much more complete scale than anything of the kind had been done in England with respect to varieties of barley. I would not say that their results were more valuable than those for instance at Rothamsted, but Rothamsted is practically the one institution of that kind that we have in this country—I mean where for a great number of years attention has been directed to solving definite problems, and it has necessarily confined itself to a comparatively few agricultural problems.

14152. They have been carrying on investigations in Denmark, extending over many years, to determine definitely the types of barley best suitable for cultivation in that country?—Yes. Since 1882 they have been steadily at work on this subject at several stations in different parts of the country.

14153. Is that Society in Denmark a voluntary society?—I cannot answer that.

14154. It probably has a grant from Government—You do not know that?—I do not know that.

14155. Is the work which they have done very important?—The work which they have done is excellent in its method, and has undoubtedly produced results of great value. The results are recognised by the agriculturists and growers in Denmark to be of great value. May I say there is one gentleman in London who helped me very much in this matter by putting me in contact with those who were investigating this subject in Denmark, that is Mr. Harald Faber: I believe he represents the Danish Government.

14156. You have something to say on what they have done in Ireland in the same direction?—The Department of Agriculture and Technical Instruction in Ireland has

conducted experimental investigation in barley growing very much on the lines of the Danish investigation, with results which appear likely to be of considerable benefit to Irish cultivators, more particularly in the direction of determining the value of different varieties of barley. I think it is an important point that in both these cases there has been co-ordination of the work by a central body, and the objects in view have been quite definite. In this way the results which have been obtained have been brought to a focus and collected together in such a way as to be available for distribution amongst growers. In this country I take it there has been a great amount of experimental culture done, but a good deal of the information is not available and it does not compare. One set of plots, for instance, in one county are conducted on one system and another in another county on a different system; there is no general direction, and if one wanted to answer a question as to the suitability of particular varieties to particular soils—I give that as a mere illustration—the work which has been carried out hitherto in this country is not applicable to the solving of such problems.

14157. Would it be your view that the Board of Agriculture, as a central authority, should subsidise or assist financially all research work of this description all over the country, in order to get the results on different soils and climates co-ordinated, and in return for the subsidy should be entitled to own, so to speak, all the information obtained, and prepare it for dissemination?—I believe that it is important that there should be co-ordination by a central body, and there appears to be no other possible central authority except the Board of Agriculture. They seem naturally to be the proper central authority for this kind of work, and of course in addition there must be local co-operation.

14158. Having got the information, I gather from what you say you regard it also as of great importance that it should be disseminated amongst people who are to make practical use of it?—That it should be edited and issued and put out by a body in whom the agriculturists would have confidence like the Board of Agriculture.

14159. Of course you are aware of what has been done by the Lawes Agricultural Trust and that certain work of this kind has been done by the Universities and by some of the agricultural societies?—Yes. With regard to research work requiring attainments of a high order, the individual qualifications needed for work of that kind are of a special nature, and the number of institutions capable of doing that kind of work in England appears to be very limited, but certainly we have two institutions at least, without referring to the agricultural societies, which have done and can do excellent work. We have the Lawes Agricultural Trust and the Department of Agriculture at Cambridge, which appear to be eminently qualified for carrying out research work. I believe those bodies are more or less hampered for want of money, and it is highly desirable that the difficulty should be removed.

14160. It is also highly desirable that the men who are engaged in doing that work should be well paid?—Yes, if you wish to get the best men.

14161. Of course it is only recently that this particular kind of work has actually been taken up by Cambridge and these other bodies that deal with the higher forms of science, but possibly the class of men who would be qualified to do the higher kind of work will increase, particularly if openings are provided for them, but that will not be so unless posts are created which they can occupy after they have been trained so that it is absolutely necessary that funds should be provided for the purpose?—Quite so.

14162. You are well acquainted with the work that has been carried on at Cambridge?—I am well acquainted with the work that Cambridge has done, and I think it has a special application to the subject under discussion. In that case they are carrying on investigations in what may be called a new branch of biological science applicable to agriculture, and with most hopeful results from the economic point of view.

14163. I should like to ask you whether the other members of your business hold similar views to yourself or whether you are only giving us your own opinions?—I am only speaking for myself. I have no authority from and I am not representative in any way of any body of individuals. As far as I know there is no body specifically representing maltsters.

14164. You have no trade society?—No, not representing maltsters.

14165. As a maltster of experience yourself, do you consider that maltsters, generally, would be benefited,

Mr. E. S.
Reaven.
10 July, 1907.

commercially speaking, if better classes of barley were grown?—Certainly; but looking at it from the agricultural point of view, it must always be recognised that there are very great limitations in the application of research to the improvement of agricultural products. The results to be hoped for must be very slow of attainment. Obviously by far the most important conditions affecting the intrinsic values of agricultural produce in this country as compared with other countries are beyond control—the conditions of soil and of weather. One finds when talking to one's agricultural friends that the replies generally are, "If you give us good seasons we will give you all that you require." That has another application. All these researches must be exceedingly difficult and tedious, and must be carried on for long periods of time, because what is true of results obtained in one season is not true of results obtained in another. At Rothamsted the work of Lawes and Gilbert is an illustration of the great length of time which it takes to establish definite conclusions.

14166. But that is no reason why the work should not be carried on?—There is every reason, I think, why it should be carried on, and why more work of the kind should be put in hand.

14167. You are a member of the Agricultural Committee of the Wiltshire County Council, and, I think, you have something to say as to your experience in connection with the instruction and demonstration carried on in that county?—I am quite familiar with the agricultural work of the Wilts County Council. I have been a member of the Committee since its inception.

14168. Are you satisfied that good work is being done?—I am quite satisfied that good work is being done, probably as good work as in any other county.

14169. And work which is useful to the practical farmer?—Work which is distinctly useful to the practical farmer. I may mention, especially, the dairy work and the farriery school. I should like to say that I am not here in a representative capacity. I am speaking merely as an individual member of the Committee.

14170. Have you any suggestions to make to the Committee on the subject? We have had full information from them as to what is being done?—I think you, probably, have all the information which you require and in a more complete form than I could give it to you in regard to the work of County Council Committees generally, but one suggestion I would like to make is that Agricultural Committees, as distinct from the general Technical Education Committees, are likely to do better work where they are separately constituted bodies.

14171. I dare say you know we have had evidence on that point from other witnesses who are of the same opinion?—Yes. I believe you have had full evidence on that point from other witnesses.

14172. Is there anything else you would like to add to the evidence you have given us?—With reference to the necessary qualifications for county lecturers and demonstrators, I may say that I am in entire agreement with the views of Mr. Trustram Eve, whose evidence on this point I had the advantage of hearing. I entirely agree with the views he put forward with regard to that.

14173. (By Mr. Norman Lamont.) You say at the beginning of the summary of your proposed evidence that "There are in existence in Great Britain institutions capable of organising research," and you instance them, and then you go on: "All these bodies, however, are more or less hampered by want of funds." I should like to ask whether you suggest that if these bodies were given adequate funds their researches should be suggested and stimulated by the Board of Agriculture, for instance, or the Agricultural Organisation Society or the Royal Agricultural Society, or some other central body so that they should all be working upon the same lines?—In the case of the Lawes Agricultural Trust and the Department of Agriculture at Cambridge—I speak of those two bodies because I know of their work and not because I suggest that there are not other institutions of the same kind; there probably are, but I am not so well acquainted with their work—I would say that they are probably in a position themselves to suggest and to know better than anyone else the lines of investigation which they could best undertake, and that they have already in hand work which needs further financial assistance.

14174. That is rather my own opinion; that each of them should be allowed to work out its own salvation, rather than any effort should be made by any central authority to co-ordinate their work?—I agree entirely.

14175. The juxtaposition of that paragraph to the one with regard to Denmark and Ireland, in which you say in Denmark and in Ireland the investigations have been conducted with control by a central authority, caused me to ask the question. This paragraph following that one rather suggested to me that you were of opinion that these institutions should also be co-ordinated and controlled?—No. I was referring more particularly to the particular kind of investigation that had been carried on in Denmark, where you have a large number of experimental plots in different districts but with a definite and single object in view, and where they have to be distributed over the country in order to answer problems which are connected with the different soils and situations and the different climatic conditions which prevail in various parts of the country. Where the common object is the same it is highly desirable that there should be co-ordination of the work.

14176. (By Professor Middleton.) I think your answers to Mr. Lamont have made it quite clear that you were speaking of two types of experimental work in your evidence, and that it is what we have been accustomed to call the field or demonstration plot in this country which wants co-ordination and control?—Yes, that applies to the carrying on of field trials with a view to showing the average results which may be expected in different districts over a series of years.

14177. But the work done by specialists at central institutions, in your opinion, needs no control?—Which in my opinion, had better be left to the bodies themselves those bodies being fully qualified to undertake it.

14178. Of course, if a person is fully qualified you would not interfere with him?—Quite so, but I take it that the number of those fully qualified is very limited in this country.

14179. Your evidence amounts to a plea for a more systematic work to be done for the agricultural industry and you have taken barley as an example?—Yes.

14180. You say our work hitherto, with regard to barley has not been enough to satisfy the needs of the farmer and the maltster?—That expresses my view.

14181. And in fact that so far as the farmer is concerned perhaps we have not any very definite knowledge to give him on the subject of barley?—I think that careful application of the work which has already been done in Denmark and Ireland alone to this country would be likely to have very good results from the point of view of the agriculturist looking at it from the purely agricultural point of view.

14182. But that is after all a matter of opinion. It is a thing which has not been demonstrated in this country itself, and, therefore, if you set out to teach the British farmer from your experiences in Ireland and Denmark he might not believe you. He might want some further demonstration actually carried out in this country, and the results placed before him?—Yes, but at the same time I would rather lay stress on the point that what is needed is not so much instruction as research.

14183. I quite agree with that, but what I am trying to point out to you is that before you can have a desire for instruction you must have some valuable material with which to instruct?—I think that is quite my point of view put in another way.

14184. In the case which you have put before us, we have not got that valuable material in England as yet, except by inference from what has been done in Denmark and elsewhere?—Yes, similar work requires to be done here.

14185. I merely refer to this as an explanation of the farmers' apparent lack of appreciation of instruction. You have not got the instruction to offer him in this case, and therefore, he cannot appreciate it if it is not there?—It is not there. You have not sufficiently good matter to offer the intelligent agriculturist—the large grower, at any rate. No doubt the small cultivator can be taught how to use manures and such like things by means merely of demonstrations, but we have arrived at a point where at any rate, the larger growers, who are responsible for the main part of the agricultural produce of the country, are now fully acquainted with facts with regard to such subjects.

14186. What you have shown us is that even if you take up any special crop, such as barley, there is a great deal of work to be done with regard to that particular crop before we are in a position to instruct?—Undoubtedly; that is the point which I wish to emphasise. The whole of the research work that has been done with regard to barley is probably little compared with what might be done.

Mr. E. S.
Beaven.

10 July, 1907.

14187. And, perhaps, barley is in some respects typical of other crops?—I think so.

14188. Are there any other crops with regard to which the possibilities of improvement are greater than in the case of barley?—I am not at all prepared to speak with regard to agricultural problems generally, but I think it is a matter of common knowledge that there are many other agricultural plants which have been improved of late years as a result of work of this kind, and doubtless there are others that may be. The work has been mainly carried out by seedsmen, but a great deal of the purely scientific work which requires to be done yields no profit, and, therefore, it has not got done so far.

14189. And the country suffers accordingly?—The country suffers for want of it to the extent that it has not been done.

14190. (*By Mr. Latham.*) Referring principally to the farmers, do you not think that they would feel that they could not be taught these special lessons that you have put before us?—I think investigations should be applied to definite practical objects, and I think if it was demonstrated, for instance, to take an example, that there were particular varieties of particular plants which were suited to particular soils and situations—I merely use that as an example—if that was demonstrated and made clear, that the British agriculturist would immediately take hold of facts of that kind, and to his advantage.

14191. It is of such a very indefinite nature that it would take a very long time to bring this to the notice of the farmers with an idea that it would be profitable for them?—I have said already that agricultural research of particular kinds appears to me to be dependent upon so many factors, that one is sure that it will take a long time to arrive at definite conclusions.

14192. I am rather afraid we must look upon you as almost the only person who takes such a great interest in this particular work with regard to barley. Is that so?—No, I think not. I would not like that impression to prevail at all. I think there are many others.

14193. To put it rather in another way, there is scarcely anyone who has come to the front like you have done on this particular question. There has been no great outcry from the farming interest generally to have this work carried out?—That is so.

14194. Is that because of their ignorance and because they do not understand the value of it?—That is a very difficult question to answer. I think the larger growers, at any rate, are more up to date in method than in any other country, but that there are still investigations to be made which would be of value to them can hardly be doubted. I do not think I can say more than that.

14195. Still, the British agriculturists have produced some of the best barley in the world?—Undoubtedly. I have said so.

14196. And I suppose your remarks would apply very much to almost all the produce we have?—Yes, I think it will be agreed with regard to almost all agricultural produce there has been considerable improvement and that there are further possibilities.

14197. I suppose this question of research would apply to almost all the products that we have?—Certainly. I am simply using barley as an illustration, because I happen to know more about that than I do of any other agricultural product.

14198. The question of research does not end with barley so far as agriculture is concerned, but wants going into with regard to almost all the products that we have?—I imagine with regard to wheat there is a much stronger case than there is with reference to barley, and I believe you have had evidence as to that here. I could have referred to the work that has been done at Cambridge with regard to wheat, and I have no doubt that what I have said with regard to barley applies to practically all agricultural products.

14199. The reason why this research has not been made so much of as it ought to have been is because of the ignorance that we have been labouring under?—I am sure we all of us have a great deal to learn. I will put it in that way.

14200. Just one word with regard to your profession. Have maltsters generally made any very great demand for this research work?—No, I should not go so far as that. What maltsters have done they have been compelled to do largely owing to the conditions of trade generally, and as the effect of competition they have had to investigate

much more closely than they used to do the character of the produce which they use. A laboratory, for instance, is now a necessary adjunct of every large malting business, and the material which the maltster is about to use and which he has manufactured, both his barley and his malt, go through to a more or less extent laboratory examination.

14201. I presume, then, that you would advocate much more science in this department, to prevent what I should term possibly the thing not being done on as good a line as it should be?—Quite so.

14202. I suppose we may take it that this will never be done in the way you suggest it should be done unless it comes from the hands of the Treasury?—I am quite sure that there are some institutions already doing good work for the benefit of agriculture that are hampered for want of funds, and that there is every reasonable probability that good results would accrue from those institutions being better equipped with funds.

14203. Would it not be very beneficial, from the point of view of climate and soil and that sort of thing, that research work should be going on at all those institutions that are coloured on the map there?—At a great many of them. I know very little of the actual working of some of the institutions, but assuming that they are well-equipped institutions like, for instance, the one in Yorkshire and the one in Northumberland, that would be desirable. Some of the university colleges have either commenced or made good headway with work of this kind, and it is desirable that those institutions should be scattered about the country more or less, because the conditions and the produce in different parts of the country is very diverse.

14204. You spoke of the variations in climate and soil, and that, in your opinion, that would be really the only way of meeting that difficulty?—It is absolutely the only way. The results which are obtained, for instance, at Wye in the average conditions which prevail with regard to soil and climate in Kent, would be absolutely inapplicable and have no relation whatever to results which might be expected in Northumberland.

14205. I see you allude to the great agricultural societies. Is not this a question which it might be an advantage for them to enter into?—I know that the work which has been carried on by the Royal Agricultural Society at Woburn has very largely confirmed the work which has been done at Rothamsted, and has been very useful, but at the same time I am not sufficiently acquainted with the possibilities to say much about the work of agricultural societies generally in this particular connection.

14206. The whole thing is of such an important character that the minuteness of the returns would barely be expected to come from the agricultural societies, you think?—I am not well enough acquainted with the resources of the various societies to give an opinion.

14207. (*By Mr. Medd.*) You spoke of the advantage that you had derived from Cambridge?—I did.

14208. And the possible advantage that you might derive from other places that you mentioned, such as Newcastle and Leeds, and so on?—Yes.

14209. Do you not think similar advantages might be obtained from Cirencester?—I do not know the extent to which Cirencester is equipped, but as it is the oldest of our agricultural colleges I imagine that they would be well equipped for dealing with research.

14210. That is my opinion. I know it intimately, but not as an agriculturist. There is an intention to make Cirencester a collegiate centre for Wiltshire and Monmouthshire, and possibly Hereford. That is only in prospect at present. Unfortunately the chairman of the governing body is abroad, but in the event of such a centre being formed at Cirencester, would not your Wiltshire farmers feel much more satisfied in going to a place close to them, where they could inspect the work very much more easily and ascertain the results of the work very much more easily, work which is so closely in many matters, social and otherwise, associated with Gloucester?—Undoubtedly the closer institutions are to agriculturists the more benefit they would be likely to derive from them.

14211. (*By Professor Middleton.*) You spoke about the much greater attention which the maltster has been giving to the quality of malt and barley within the last few years. Is it not the case that we have had many complaints about the quality of English barley within the last 10 or 12 years?—There is a general impression that the quality of English barley is not as good as it used to be—the average quality.

14212. Is it not the fact that while there is a great deal of good barley in the country there is also a great deal of very bad barley in the country? Is it not very variable in quality?—That is so, but at the same time I would attribute that largely to the character of the seasons and other matters which are out of the control of the individual agriculturist.

14213. Even in similar seasons, when a district has had a season which suits it, you will find good and bad barley coming from that particular district. Does not the maltster find that barley is a very variable product?—It is an extremely variable product.

14214. That shows that some men or some conditions produce good quality while others produce an inferior quality, and that there is, therefore, room for improvement?—Yes. It is only fair to say that many agriculturists would answer in reply to that, that is largely a question of prices, and that it has not paid the farmer to give special attention to the quality of barley, but rather to consider the yield.

14215. (*By Mr. Latham.*) You know there is a larger

quantity of barley being grown now after green crops than formerly?—Yes.

14216. Does that tend to an appreciation of it or a depreciation of it?—I should say it tended to depreciation; but at the same time I am inclined to think that at present prices it increases the yield to an extent that more than compensates the farmer from the agricultural point of view.

14217. Is it a better barley for you as a maltster?—No, it is not so good.

14218. (*By Lord Barnard.*) I suppose you know the Board of Agriculture have not overlooked this subject of research. You have heard perhaps that the matter is under consideration, and that proposals for the extension of research work are being considered?—I have heard that, and I suggest that it would be very desirable that this should be done.

14219. Are you a barley grower yourself?—I grow barley every year; a matter of a few acres for experimental purposes.

14220. You do not farm?—Not otherwise.

Mr. E. S. Beaven.

10 July, 1907.

Mr. CHRISTOPHER TURNOR, called and examined.

14221. (*By Lord Barnard.*) You own a very large agricultural estate in Lincolnshire?—I do.

14222. Is it entirely in Lincolnshire?—Entirely.

14223. You farm a great deal of land yourself?—I farm 3,000 acres.

14224. You take a great interest in the development of higher agricultural education in rural districts?—I do.

14225. I believe you are a member of your County Council?—I am.

14226. Which Council is that?—The Lindsey County Council.

14227. Are you a member of any agricultural committee of that Council?—Only of the Small Holdings Committee.

14228. You are a member of the County Councils Association?—I am.

14229. They have asked you to come here, so that you have come in that representative capacity?—Yes.

14230. I believe you have given a good deal of consideration to this subject of higher agricultural education?—I have for a good many years back, both in this country and abroad.

14231. What is the general principle which you lay down as to agricultural education?—My own feeling is that one wants a consecutive and complete system working from the elementary schools, through the secondary schools and farm schools, to the higher agricultural education; that we want to distinguish the higher agricultural education from the education for farmers' sons; we want to distinguish between the education of the men that are going to be directly associated with land and get their living off the land and the expert. I think that the agricultural courses at agricultural colleges or at universities almost, such as Oxford and Cambridge, and perhaps one or two of the other universities, is the right place for teaching the expert.

14232. With regard to elementary education, you are, of course, aware that that is really outside the scope of our enquiry?—Quite. My only feeling was that we should just touch upon it as the foundation for working upon, because I feel that if the elementary and secondary part of education is in any way neglected, much time may be lost in finally dealing with the higher, because after all the higher is supplied from the elementary and secondary sources.

14233. Of course you understand as this is a Departmental Committee we only report to the President of the Board of Agriculture and he has no power over secondary or elementary schools, although he might, if he thought fit, make recommendations to the Board of Education on the subject?—Exactly.

14234. So that practically in that way it might be touched upon. The County Council Sub-Committee on Rural Education, you say, have issued a recommendation which fairly well meets the case of the elementary schools?—Yes.

14235. What was that recommendation?—Chiefly with

a view to increasing nature study in the elementary schools and giving an agricultural bias to the existing education to interest the children that were going to live on the land, or ought to remain on the land, and at the same time from a purely pedagogic point of view to give them the teaching which experts admit generally is one of the most valuable trainings for the mind and the intelligence, and hand-in-hand with that nature study, to have school gardens where practical gardening can be taught at the same time, using the school garden as a demonstration ground for nature study, and, as far as possible, to bring in agricultural arithmetical problems, bearing on everyday life, instead of the abstract text-book problems which I am sure interest the children very little.

14236. Have you in your mind farmers or labourers, or both?—Both.

14237. Your opinion is that it does not much matter whether a man is going to work in a country district or not—that such training is equally valuable to him?—Equally valuable. I have had very clear evidence of that in some cases of manufacturers and merchants saying that they find with boys coming from a school where there is nature study and school gardening properly taught, that their intelligence was very much more developed, and that they were really worth 50 per cent. more to them than boys who had not had that training.

14238. Have you anything to say on the subject of secondary schools?—Yes, just to touch upon it in general terms, I feel that there again, where there are scientific courses in rural grammar schools and secondary schools the scientific instruction should have a rural bias and be of some use to the farmers' sons. At present such farmers' sons go to the secondary schools as have no instruction given them in most counties that would interest them in the land, or really so to stir their interest as to make them wishful of going on to a higher institution, which I think is one of the chief functions the secondary school ought to fulfil.

14239. Are the farmers' sons fairly well educated in Lincolnshire?—Fairly well, and a fair number of them go on to the Midland Institute.

14240. I was rather referring to their general education?—Yes, they are fairly well educated generally. You see the farmers in Lincolnshire are bigger men and are generally well off for farmers.

14241. Have you in any of the districts in Lincolnshire what is known as an agricultural side to your secondary schools?—I am not aware of any one with a definitely agricultural side. I am afraid we are rather behind in that matter in Lincolnshire.

14242. (*By Mr. Latham.*) Do you really think you are behind in not having agricultural sides to your secondary schools?—I would like to see agricultural sides to secondary schools. I want to see definite farm schools as well, but in country districts where there is at the present minute only the secondary school, I think that until other schools come that can take their place, that in those secondary

Mr. C. Turnor.

Turnor.

10 July, 1907

schools the scientific education that is given ought to have an agricultural bias.

14243. (*By Mr. Medd.*) Do you know Beckford School in Somerset, Mr. Henry Hobhouse's?—No. I have heard a very little about it.

14244. That is a type of school you would wish to see?—Precisely.

14245. Where everything is differentiated towards rural subjects?—Exactly.

14246. You in Lincolnshire have neither one nor the other?—We have neither one nor the other.

14247. (*By Lord Barnard.*) A great many witnesses have told us that the only places where the practical farmer can learn his business is on a farm?—I quite agree, but I do look upon an inclination towards agriculture being given in elementary and in secondary schools as most important, because we know a lot of young farmers do not learn their business on their farms for the reason that a great many of them are not sufficiently instructed in plant life and growth to take any interest in their work, just as you can have a gardener in a school garden who will show a boy how to dig, and perhaps teach him to dig fairly well, without interesting him the least in the work. That is where advanced pedagogy comes in in instructing the child to take an interest in his work rather than become a mere mechanical machine—to interest him and make him thoughtful and intelligent in what he is doing.

14248. Perhaps you will agree with what other witnesses have told us that before the lad goes on the farm he should have the best general education that he is capable of receiving?—I quite agree, on the condition that such general education should not be of an abstract character or too much based on text books.

14249. Your idea is that you can give that general education with an agricultural bias quite as well if not better than without it?—I consider better than without it.

14250. What you have said about elementary schools applies very largely to secondary schools?—It does.

14251. We have been told that if you get a well educated young man, and he subsequently has had two years' practical experience that it may then be a great advantage to him to go either to an agricultural college, or perhaps almost better, some witnesses think, through short winter courses at some agricultural institution. I suppose in Lincolnshire they go to the Midland Institute?—Yes, for a definite course at the Midland Institute, and I have always found that that course has been directly beneficial.

14252. You are of opinion that money which is spent in other ways than in the giving of an agricultural bias is wasted?—I would not go so far as that. It depends upon what type of instruction is being given, but I think at present a great deal of money is being wasted in the present agricultural education because it is not beginning at the beginning, but, rather, much money is spent on advanced courses and lectures, which are not attended by the people that it is desired to reach; largely because the bias has not been given in the early days in the elementary and secondary schools, and my opinion is that in the present state of development a great deal of the money now spent in lectures might be much better applied in giving that bias in the elementary and secondary schools, and then when there is more demand for it, later on, to develop the system of lecturing further.

14253. I forget whether you have lectures in your district or not?—Yes, we have at times.

14254. You are perhaps aware that the system of lecturing is rather on the decrease?—Yes.

14255. At the same time it is felt by many witnesses here that lecturing is an extremely valuable means of arousing interest amongst the farmers?—I think that the system of lecturing can be made most splendidly useful in that respect, but as I say, I think that where the village squire or the clergymen gets the lecturer down and he and his family go to hear him lecture with perhaps two labourers in the background and a farmer and a farmer's son, because that is generally about the audience, that very little benefit is derived, and I think we can learn a great deal from Italy in that respect. They found in Italy that these lectures did very little good until they had first roused interest by taking groups of farmers and labourers to an institution and showing them all the wonderful things that were going on there in the shape of experiments and so on, and then after that giving them a course of lectures in the district explaining further to the farmers what they had already seen in the institute and the kind of work that was done there. The first set of lectures they gave in Italy were a

failure, but the second set carried out on the lines I have just indicated were very very successful, and I think it would have the same result in England.

14256. In many cases we have been told that the lecturers have got into communication with farmers, and that very beneficial results have followed by encouraging farmers to seek information from them and take an interest generally in improved methods?—I quite agree with that, but so much depends on the lecturer, whether he is a man who is able to influence the farmer or not.

14257. Yes. We have also been told that farmers are very quick in finding out if a lecturer is making a mistake of any kind?—They are very quick indeed.

14258. You think the agricultural industry in this country is not treated as well as other industries, by not having a sufficient amount of money allocated to it?—That is a point I was making. The amount of "whisky money" spent in education directly benefiting agriculture, to take the Lindsey Division alone, within the last two or three years has decreased from £1,800 being spent upon agricultural education to £1,000. That is on agricultural education in the widest sense for lectures and every possible thing. I would like to see £2,000 spent on education directly beneficial to agriculture, and I would include in that an increased number of holiday courses for teachers at the Midland Institute. I advocate the spending of more money in increasing the agricultural bias to the instruction given in the elementary schools and secondary schools, increasing it generally, and finally if there is a demand for it, increasing the number of lectures too, but I would let that come last, after the interest had been roused by other means.

14259. On that point it is scarcely benefiting agriculture at the expense of other industries, because in your opinion that is more in the nature of general education?—Yes, it is general education. I consider you cannot benefit agriculture without benefiting other industries. I am very strongly of opinion that you must look upon agriculture as an industry outside of and apart from other industries, because it really is the foundation of the social condition of the country, and one must take that stand for agriculture, and therefore that what benefits agriculture will be benefiting other industries too. That was realised in northern Italy very strongly, where those in authority made manufacturers and merchants realise that their best market was in northern Italy, and that to improve that market and to increase it they must improve the education of the agriculturists. They took steps to do that, and we have seen the result. The improvement in northern Italy has been most marvellous. Every sort of agricultural facility is now given in Milan. I like the word "facility," because it covers a great deal.

14260. I see you mention Belgium. Are you familiar with what is done in Belgium?—To a certain extent only.

14261. You compare Belgium with England?—Simply this: that although Belgium is a free trade country they have followed what I think is a sound axiom of political economy in fostering wisely the producer, considering that agriculture is the chief industry in the country they have given it its full share of educational and other facilities. They consider that there the agricultural producer is the most important man in the country, and they have given him every kind of facility that is possible in the way of agricultural education, and agricultural banks; also the movement towards co-operation in Belgium has been very remarkable, whereas with us after 10 years we have only a turnover of some quarter of a million in all our agricultural co-operative societies. In Belgium I believe it is something over eight millions a year in the different centres. Belgium has done all this for agriculture without in the least prejudicing the other industries, since at this present minute Belgium manufactures more per head of its population than any other country in the world; I believe 50 per cent. more than England; and at the same time Flanders feeds its whole population off home-grown food stuffs.

14262. May I ask what the population of that country is?—The population of Belgium is the densest in the world except China—588 people per square mile, which it feeds entirely off its own home-grown food stuff. The figure in England is 133 fed off home-grown food stuffs; and in Belgium again, where small holdings have been very largely developed, about the highest average production per acre that is reached. I cannot give you the figure of the turnover per acre, but I know from talking to the

head of the Belgian Agricultural Bank that the annual average savings of a father and two sons, working on a 25 acre holding, has been as high as £80 per annum after paying all their expenses. That was in the particular district round Bruges. I did not go into the question how far that extended all over Belgium, but taking it that a similar holding in Lincolnshire is giving the head of the family about £75 a year to live upon—I believe that is how it works out, although it is hard to get data in England—it shows that Belgium is producing very largely and very profitably. Of course it must be remembered that they live frugally in Belgium, and that they have not the standard of living that we have in this country.

14263. I suppose it is very good soil?—It is very good soil, but I think we are better off in this country, both in the way of soil and climate.

14264. What is your opinion of the source from which we ought to obtain a grant for agricultural education?—I suppose the Treasury is the final source. What I feel is this, that wherever there have been two authorities controlling education there have been difficulties. That has been the case both in Italy and in France, and we cannot expect the Treasury—I am speaking entirely as an outside man simply wanting to see the utmost grant—I cannot see how the Treasury can be induced to give a large grant unless there is a consecutive and complete scheme of agricultural education formulated and submitted to it, and one that it can be satisfied will work well and smoothly in the country.

14265. Do you not think these ideas of complete schemes are very often difficult to realise?—Undoubtedly. I think any scheme is very difficult to realise. It takes a very great deal of working out. But still in France they set to work about 30 years ago, when the agricultural depression began to be felt, and asked themselves the question, "How are we going to meet this agricultural depression? How are we going to meet the increased competition from the new countries where the cost of production is very cheap?" The answer was: "By increasing the production per acre." Then they asked themselves: "How are we going to increase the production per acre?" and the answer was: "By teaching the people better methods, by instituting co-operation, and by giving every agricultural facility." It was about 30 years ago, I think, that they began their definite agricultural scheme; it would be about 1870 or 1875.

14266. Of course you realise that the Treasury draws its resources from the pockets of the people, so that any increased grant to agriculture would mean probably an increase of taxation?—Yes, but I would not like to use the word "increase" generally to agriculture. I should say an increased grant to education. I think that the right way of looking upon money spent in really sound education is not so much in the light of an annual expenditure, but in the light of the best possible investment to which public money can be put, if we can secure a sound scheme and not one that is overlapping; it is pathetic at the present minute to see how much overlapping there is, and to realise how little we are getting for agricultural education in proportion to the whole amount expended.

14267. When you say "overlapping," to what do you particularly refer?—I have not studied the question of grants very much, but I am aware of certain cases where grants have overlapped, and there have also been certain grants to institutions that perhaps are not doing to the full what they might for the purely agricultural students. I think perhaps my fellow witness from the Association may be able to deal more with the question of grants, because I have not studied that Blue Book. I have just glanced through it.

14268. You say here: "There seem to be three main suggestions for improving the control of agricultural education." Will you tell us what they are?—I have set them out here under three heads. The first is, "That the Board of Education should have complete control of the agricultural education as part and parcel of the general scheme of education in rural districts." Secondly, "That the Board of Education should have complete control over all work done in the elementary and secondary schools, and the Board of Agriculture entirely responsible for the higher education (farm schools, colleges, and research stations)." And thirdly, "That the Board of Education should be the authority on the pedagogic side of education, and the Board of Agriculture take over the technical instruction or any instruction having a direct bearing on agriculture." My view is that some sort of scheme must be worked out and arranged before we could hope that the

Treasury would really take up the question of giving largely increased grants for agriculture. I speak entirely as an outsider, and as only wishing to see a complete control whatever Board has it. I do not really mind as long as it is a complete and satisfactory control of the agricultural side of education. First, I should like to see a complete scheme, a consecutive scheme, of agricultural education, and I would like to see that scheme carried out under suitable control. Talking to different people in the last few months I have heard these three different suggestions in regard to that same control of agricultural education. I jotted them down here, and that really is as far as I can go with regard to it.

14269. I am afraid I must point out to you that even under your three headings you deal with the two Boards?—Quite.

14270. You do not leave it entirely in the hands of one?—As long as a really well-working plan can be arranged, that would quite meet the case, and secure more money for agricultural education; that is the thing that I am really keen about.

14271. Some of the witnesses who have appeared before us have drawn a distinct line between the word "education" and the word "instruction," and consider that what is commonly called agricultural education is more or less in the nature of instruction, sometimes of a very simple character, but going on to the very highest forms of scientific instruction, and that the Board of Agriculture, as being the Board closely associated and identified with that, and having full and complete knowledge of all the circumstances of the agricultural industry would be a more suitable authority to control such effort?—Quite.

14272. I do not know what your view on that is?—I am hardly competent to say; but taking the layman's point of view, as an agriculturist, I am not satisfied with the way in which agricultural education is being given. I do not think that there is a sufficiently developed system, and whatever Board it is developed under makes very little difference, or whether it is developed under the two Boards by a joint control, if a working scheme for such control can be devised.

14273. With regard, for instance, to demonstration plots which are carried on very largely in the country, that is a matter which still could be better dealt with by the Board of Agriculture?—I quite agree. Wherever there are demonstration plots for research purposes, then I do think emphatically that that ought to be under the Board of Agriculture.

14274. The whole staff of the Board of Agriculture must of necessity be more familiar with such a subject than the staff of the Board of Education?—I quite agree. I think that research ought to be entirely under them, and ought to be encouraged in every possible way; but, of course, when you come to nature study and to an agricultural bias being given in elementary schools, that must perforce be under the Board of Education.

14275. You have laid down very clearly, I think, that the elementary schools should provide education with an agricultural bias, but not scientific or technical instruction, and those are the subjects to which this Committee is limited?—Quite.

14276. You think scientific and technical instruction would be better appreciated if the agricultural bias were given in the elementary and secondary schools?—Quite.

14277. You have some remarks in your *précis* as to changed aims in some of the agricultural colleges. If you look at that map there, on those red spots, those are institutions supported by public money, but in addition to those there are other institutions which are purely private. I do not know whether you are referring to public institutions or to both?—I was, on the whole, referring to public institutions.

14278. I suppose you are fully acquainted with what is carried on at those institutions?—Yes; to take Cambridge, and, I hope, Oxford soon, there we get to a different type altogether, a centre that I hope will furnish the expert; and, of course, Cambridge is doing such valuable research work now that I think it is in every way entitled to as much grant as it possibly can get, perhaps more for the research than for the instruction it is giving to its pupils or students, because there again I think that comes into a very different heading. Where the pupils are landowners' or land agents' sons, or the sons of professional men I think they ought to pay fees which ought to be sufficient to support the college to which they go. The same with regard to Cirencester. I do not think Cirencester does receive a grant. I was at Cirencester myself for a year or

Mr. C.
Turnor.

—

Mr. C.
Turnour.
—
10 July, 1907.
—

two, and I believe, by the way, that Cirencester was originally started with a view to dealing with farmers' sons. I think that was the case at the first start; but when I was there I do not suppose there was a farmer's son in the whole college. One sees the same tendency in a great many other institutions that have started definitely for farmers' sons, to gradually be rather taken possession of by the sons of landowners and professional men.

14279. As no public money goes to Cirencester, its circumstances cannot be complained of, at any rate, as far as public grants are concerned?—No. Of course, one can take the Midland Institute as a very typical institute, where the whole of the scholars are farmers' sons, I think, without exception.

14280. Would you take it from me that the evidence we have had from masters of these collegiate centres, those red spots, is practically identical with what you have stated with regard to one of them?—I understand that at Reading a large number of the people who have gone there are clergymen's sons who are working up for posts abroad.

14281. Quite so, but the posts they are going to take up are connected with agriculture?—Yes, but I was drawing a distinction between the pupil who is actually a farmer's son, and who is going to make his living off the land, and the pupil who is the son of a professional man or a country gentleman, who is going to become, perhaps, a land agent or to hold some Government post.

14282. I feel very strongly that this enquiry should not be limited to farmers' sons, but should apply to the whole agricultural industry, and that would include those who are going to be engaged with the land in any capacity whatever?—I quite agree as far as increasing the educational facilities goes. I should like to see all the universities with agricultural courses, but with regard to the giving of grants, when the grants are so limited as they are at present, I hold that an institution which was dealing entirely with farmers' sons ought to take precedence of institutions and colleges that were also attracting a large number of sons of people better off. Take Wye College for instance. That has a great many sons of landowners and professional men going to it. As soon as we secure increased grants, then let all the institutions have as much as possible, but I do feel that at the present minute the institutions to encourage most particularly are the ones that are actually dealing with the farmers' sons. I put it that way.

14283. What harm is done even if the richer man goes, so long as he does not exclude the poorer man who wishes to take up agriculture as a business in life?—I think that is all right, but do you not think there is a danger, when the sons of the rich people come, of their gradually crowding out the farmers' sons, and the whole scale of living at the college going up?

14284. That we have not had any evidence of?—I only make the suggestion.

14285. (*By Professor Middleton.*) It is the institutions that are doing most for agriculture that want help, you think?—Yes.

14286. It does not necessarily follow that that institution is an institution which is educating the farmer's son?—Exactly.

14287. Your opinion is that the institution that is doing the most for agriculture should receive the greatest aid?—Exactly.

14288. (*By Mr. Latham.*) What is to prevent them going off the land after they have had this education?—Although the actual handling of land is a very harrassing occupation, still it is a most interesting one.

14289. I do not see why we should have these facilities offered to us unless we are going to return to the occupation you have so much at heart?—Yes, but do you not think in most cases they would return?

14290. No, I do not.—My experience in Lincolnshire is that they do return to the land when the opportunity is given. The farms are generally taken on by the sons of former tenants.

14291. (*By Mr. Medd.*) Would you not agree to this: that scholarships should be limited only to those whose parents are below a certain income?—Yes.

14292. (*By Lord Barnard.*) That is a matter within the discretion of the County Council or the governing body which gives the scholarship?—Quite.

14293. Are you a member of the Governing Body of the Midland Institute?—No, I am not. I have been over it several times.

14294. Have any of your tenants been there?—Several.

14295. Do you converse with them about the instruction they have received there?—Yes, and they are certainly very keen about it.

14296. You think the results are good and that the farming has improved?—Certainly, and they certainly appreciate the course.

14297. Do more go there now than used to go?—I can hardly say, and I do not know of any one from my immediate neighbourhood at the Midland Institute at this minute.

14298. What is the opinion of farmers generally on the subject of such institutions?—In Lincolnshire they have made a very clear pronouncement indeed that what the farmer wants now (and that is from the majority of the farmers that I have talked to) is to keep up their practical skill to the utmost, and to receive such benefits as can be conferred by institutes in the way of definite scientific advice. Even the farmers who use artificial manures do not use them scientifically, often buying ready-mixed manures of inferior quality.

14299. Practically wasting money?—Practically wasting money, and the same with the cakes. Societies are doing a great deal to counteract that. Associations of farmers have combined and have had these cakes and artificials analysed, and they have done a great deal to check the use of inferior material by farmers, but the fact remains that there is still great room for improvement. In my part of Lincolnshire where there are very large farmers they are very intelligent indeed; there are a great many who are first-class farmers, whose methods could only in a very few directions be improved, yet I think many of them would admit themselves that they could learn a good deal in certain directions.

14300. Do they consult the College at all?—I have not the figures, but I think to a certain extent they do. Of course at Wye College they are consulted very largely indeed, but I have not any figures for the Midland Institute.

14301. Do farmers in the county consult the lecturer, and ask for advice?—My own expert (Mr. Murray) was for five years a lecturer at the Midland Institute, and he carried on experiments in all sorts of grains, barley and wheat and so on, all through my neighbourhood, and a good many farmers have consulted him.

14302. I think you will agree that the shyness of farmers with regard to seeking for information is gradually being broken down?—Yes; but there is a great deal of difficulty. Take the case of an expert at a college. He goes to a certain farm, perhaps being farmed by a very advanced and intelligent man, and he carries out experiments on that farm that may have quite striking results, but even the next door farmer will not know about that. The farmer himself will not talk about them, and the farmer next door would think it would be rather prying or inquisitive if he were to come round and see what was being done, and the consequence is that I know of cases where remarkable results in barley have been achieved in Lincolnshire which have been treated by Mr. Murray for four years running, and not one single farmer came to inquire or displayed any interest in what was going on. That is one of my points in favour of having a definite profit and loss demonstration farm run by the different colleges.

14303. I must say you somewhat surprise me. I was under the impression that the information obtained by one farmer spread amongst his friends and neighbours very, quickly?—I am only speaking from what I have observed myself in Lincolnshire, and that is what I have found there.

14304. I thought farmers, particularly, had many opportunities of meeting together and discussing these things on market days and at their clubs and so forth?—Yes, but when it is a question of going into the relative merits of artificials, for example, a farmer does not care to enter into details. A farmer might say: "I have bought soot at 30s. a ton; it is grand stuff," but he would not go into the question as to which was the most profitable—soot at 30s. a ton or nitrate at £11 10s.

14305. Does not the Midland Institute publish the results of the experiments that are carried out?—They do, and I have had them all.

14306. Cannot you get those reports into the hands of the farmers?—They undoubtedly do get into the hands of a good many, and I am glad to say an increasingly large number, but still I think that the very form of those publications is often rather puzzling to a farmer, and if he could be taken over a demonstration farm where he could see a field of wheat or a field of barley that was obviously a heavier crop than he had seen on that field

for the last 20 years, and had the figures explained to him, he would take that in and understand and remember it much more than he would a whole pamphlet of five or six pages of figures.

14307. The results of those experiments are not explained in sufficiently simple language, you think?—I would agree with that in many cases.

14308. Perhaps you will agree with my opinion that I expressed several years ago that the means by which the conclusions were arrived at were expressed at too great length and not merely the simple result given?—Exactly. What we want really is a simple business statement of the results.

14309. A scientific man requires to know all the details but a practical man only wants to know the actual result?—Yes. The practical man has not got the time; the daily round of work leaves little time for reading.

14310. You raise a very important question here. You have some very strong opinions as to the necessity of profit and loss farms as distinct from the ordinary experimental college farm, a scheme which you say would be a practical demonstration on commercial lines of the new methods of farming. Perhaps you will explain that?—I believe Bangor has got more nearly to that type of farm than any other institution. At present, if a farmer goes over the farm attached to an institution or college, he sees all sorts of experiments being carried out, often very costly experiments, with the result that the farm cannot be made to pay.

14311. You do not need to go into that. We have had lots of evidence on that point, and we can understand that an experimental farm cannot be made to pay. We want your suggestion as to a profit and loss farm?—My suggestion with regard to that is simply this: that a farm should be taken, obtaining the money from some source, and that a first-class manager or foreman, preferably one who had been through—as well as having practical knowledge—a course of agriculture at some college or institute, should be placed in charge, and be responsible to the head of the college for the farm; that the head of the college should lay down the general principles on which it was to be farmed. The heads of colleges have a tremendous lot of hard work to get through as it is, and have not time to give to the details of farm work. The farm should embody and work into a complete system of cropping any particularly excellent methods employed by the best farmers of the locality. One good farmer often specialises in one thing, another in another. Further, it should give a practical demonstration on a commercial scale of the facts discovered at Cambridge and Rothamsted. The farm might be anything up to 400 acres in size.

14312. Would not that scheme be a very costly one?—I do not think so if it was run on business lines. Of course, there would be the capital to raise in the first case, but I see no reason why we should not make such a farm pay as well as any other farm.

14313. (By Mr. Latham.) I suppose your experience is that nearly all model farms do not pay?—It depends upon what you mean by a model farm.

14314. An experimental farm?—I hate experiment. I would not have an experiment on the farm. Take, for instance, what is definitely known now about leguminous crops, and what they will do—especially lucerne—in the way of improving the soil. Those are the points I would take up.

14315. (By Mr. Lamont.) You are differentiating between a profit and loss farm and an experimental farm?—Exactly. I have a very strong opinion as to the practicability of it. I feel that a demonstration farm on modern methods showing the revised cropping, because it would come to a question of revised cropping, would be a success. You see men throughout the country who have given up the four year rotation. That did very well up to a certain period; it undoubtedly made English agriculture what it was 40 years ago, and led up to the zenith, but now many new discoveries have been made, and, for myself, I would like to see careful accounts and records kept of a demonstration farm, half under leguminous crops and the other half under wheat and barley. For instance, I would call Mr. Prout's farm very emphatically a demonstration farm, and I would like to see more of such demonstration farms. That is a very interesting case. I do not know whether you have seen the figures of that farm. I think there should be more like it. Mr. Prout's farm gives us no data about feeding cattle, and I would like to see a demonstration farm issuing a monthly bulletin giving the full value per unit of the different food stuffs in the market, because the market varies. As an instance

of that I may tell you that the other day I found I was paying 1s. 6d. per unit for concentrated food which I could have bought just as well at 11½d., and when feeding hundreds of beasts that makes a very serious difference, but it is a thing that very few farmers pay much attention to. Then with regard to the question of fattening, whether stall or yard feeding, in summer, the grass this summer is very poor, and I have been feeding, steadily, two-year old bullocks, and they have been coming on wonderfully off lucerne, keeping at the rate of, on my poorest field of lucerne, four beasts to the acre. If that goes on I need not point out what a very important thing that will be for that district. My daily cost of feeding those beasts comes out at 5½d. Counting the cost of the first two years' production it works out at 4s. a ton the second year. The next year the lucerne will be free of cost except the cost of sowing and cutting and leading into the yards, which comes out at a penny per day, and, in addition to that, I am feeding them with 3 lbs. of barley and 3 lbs. of chaff. I weigh the beasts at the commencement and at the end of the course, and I shall know by September exactly how much it has cost. We want a great deal more of that kind of data, and the authorities ought to aid in that movement much more, and I maintain that that work ought to be done by State or locally aided demonstration farms.

14316. (By Lord Barnard.) Would you suggest that the farm should be found by the local authority or by the State?—That I really have not gone into—as long as it is a farm run by public money.

14317. Certain experiments of that kind have been carried on by the Newcastle College, and, I should think, probably elsewhere, not only with cattle but with sheep at the County Council Farm in Northumberland, and in dairy cattle at the Offerton Farm?—Yes; but still it is very difficult to get clearly from the results of those experiments in a form that an ordinary layman can understand.

14318. That farm does not belong to the county. It is managed by a very intelligent Scotchman, Mr. Maclaren, who carries on a large dairying business, and he has consented to allow the local authorities to weigh and measure and take a record of the feeding, and so on?—That is exactly what I should like to see established.

14319. That is done without purchasing a farm at all and at very little cost. Do you not think it would be possible to carry it out in that way?—Yes, but my object of a demonstration farm was really to secure an all-round demonstration. One man may be growing barley very well and others specialising with other crops. There is one man in Lincolnshire who is following a seven year routine. He is a successful farmer, and by adopting that course he has done very well, but nobody else has followed it for the reason that there has been no record of it, and if what he has discovered within the last 15 years could be embodied in a demonstration farm and a careful record kept and information as to the question of feeding stock in general you would have a complete demonstration, and I would like to see complete demonstrations in every part of England, varied to suit the locality.

14320. I should have thought it would have been too costly and too risky to be undertaken solely at the public expense, but you do not think so?—I do not. Of course, the whole thing will depend on the management.

14321. Supposing some financial assistance were given for that kind of work, do you not think that it could be much better carried out by a gentleman, like yourself, who might be willing to utilise your land for the purpose instead of a county having to acquire a farm at the public expense?—Yes. I think if that could be worked it might be one of the best ways of doing it, only I should like to see it worked as a complete demonstration.

14322. You say in your *précis*, "I have also heard many of the more progressive farmers say in regard to the experimental work that they were interested, but they could not think of trying to follow up and avail themselves of results arrived at on a bit of ground the size of a hearth-rug"?—Yes. That is one more point in favour of the demonstration farm. I have had many of my farmers say, "If you can show us on your own land that lucerne and these leguminous crops do what you say they will do that is one thing; we have read about things that are being done, and also about what is being done at Rothamsted, and we will follow a demonstration if it is a commercial success, but it is our business to pay our rent and we cannot risk anything in experimenting," and I should be very sorry if I found farmers all round embarking in what I call experiments, but when you can show them, by putting

Mr. C.
Turnor.

10 July, 1907.

Mr. C.
Turnor.
—
10 July, 1907.
—

before them a concrete case in certain districts where the grass, for example, is very bad and the field is worth very little indeed, and you can say to them: "visit a demonstration farm and you can see what sainfoin has done on this land which at one time was not worth 2s. an acre," the farmers are willing to follow your example. That was done in one case that I can speak to. The sainfoin was put down on that poor land and the following year they got £5 an acre for the hay, and there was a heavy aftermath which carried more sheep than the field had previously carried throughout the course of the whole year.

14323. Is it not a fact that farmers do experiment, particularly at the present day?—I think there is a greater tendency on the part of farmers to experiment. I think they are showing a very greatly increased interest in it, but the difficulty is this; Is a farmer competent to arrive at a right conclusion? Am I competent myself to arrive at a right conclusion, even with the amount of chemistry that I have studied? I feel that one wants definite guidance before one can arrive at correct conclusions; and even to take the case of where a crop has failed it wants very careful consideration and more time than any ordinary farmer can give to it to ascribe the failure to the right causes.

14324. Your object is to encourage farmers to try new methods?—Yes, and further I say that now a man is not really a practical man unless he is using new methods and all that science can do for him to the full.

14325. You have given us in your *précis* an account of what you saw at Perugia?—Yes; and to sum it up briefly, they have a demonstration farm there very much on the lines that I would like to see established in this country, only they go a degree further there than I hardly think is necessary here. I believe they were given an estate. They have a demonstration estate showing the best methods from a landlord's point of view of dealing with it. I think perhaps that is more necessary in Italy than it is here because the estates are more run by land agents there, and they are different type of men from ours. The demonstration farm on the estate pays the best, and shows how the utmost produce per acre can be obtained. The produce per acre off the demonstration farm is decidedly in excess of the produce per acre off any of the other farms on the estate.

14326. Is this a State institution or a voluntary institution?—It combines the qualities of both. It is State aided as far as research goes. I may say that the Principal spoke nothing but Italian and my Italian is not very good, so that there were one or two details that I did not quite arrive at, but I understood him to say that it was State aided as far as research went, and also for the Perugia section it was State aided, but for the estate department four or five miles away from Perugia it was not State aided. If you go ordinarily over the Perugia Institute you simply see the College buildings and the experimental farm immediately below, just like our experimental farm at Kingston.

14327. I think you have gone through all the points with regard to which you have given us a note, and briefly to sum it up you wish to impress upon the Committee that the agricultural industry might be more largely benefited, and that it is essential that the agricultural industry should receive largely increased grants for giving instruction of various kinds?—Quite.

14328. I do not know that you desire to go through those grants?—Just as you wish.

14329. The members of the Committee will bring them out in their questions to you?—Yes.

14330. (By Mr. Acland.) I should like to know if you think that in view of the necessity of a considerable increase of money to be devoted to agricultural education it would be sufficient to go on the principle of giving State money to meet local money or whether you think that there is such a strain on local money at present that even a generous offer of State aid to meet rate aid would not produce any great development of things in general?—What I feel about that is that State aid going to increase the local authorities' grant ought to be sufficient if it could be supplemented by a grant for the training of teachers. I think that the training of teachers ought to come definitely and distinctly and entirely from the Imperial Exchequer. That is national work, and of course naturally has a direct bearing upon agricultural education too, and if teachers were properly trained, and had agricultural instruction given in their training that would relieve the local rates of a very considerable amount of expense, and I think if that was done that local authorities could meet the remaining items of expenditure. At all events, for the

present if one could double the amount coming from the "whisky money" and get two or three times the grant we get now in each locality it would certainly meet the needs of the case as we at present find them; but the demand for agricultural education would go up a great deal more in consequence of a bias being given in elementary and secondary schools.

14331. Do I understand your point is that you might still leave a certain amount of the aid of agricultural education to local rates, but in order to do that with any possibility of success you ought to relieve the rates of one of their present heavy burdens in educating the teachers?—Precisely.

14332. I understand that you are rather of opinion that in the present stage of development of agricultural education there is a possibility of wasting money on lectures?—Yes, I do feel that, and courses perhaps even in schools that result in a waste of time from the previous general education that has been given to these pupils not having fitted them for the instruction. There is a great waste of time there because their minds have not been turned in the right direction at an earlier age.

14333. Do you complain of the lack of quantity or the lack of quality of the secondary education of farmers' sons?—I think it is certainly a question of lack of quality.

14334. So far as your experience goes is the neighbourhood which you know adequately supplied with secondary schools?—That I am hardly competent to give evidence upon. I really have not gone into that, but as my personal opinion, without having gone into it, I think there are sufficient.

14335. Is it the habit of farmers as you know them to send their sons to fairly good secondary schools?—I do not think it is at present at all, particularly where there is a good elementary school and perhaps quite private continuation courses held by the teacher. In that case farmers do not send their sons beyond that elementary school.

14336. Do you think that is due rather to lack of appreciation of what exists than to lack of supply?—I think very largely so. In many districts they feel that the education to be derived by sending them on to a secondary school is not sufficiently practical, and not worth the time that is going to be spent upon it. I quite share the feeling that most farmers have, that if anything there is too much education now, only I qualify that by saying too much of a wrong sort, too little of a right sort.

14337. You can conceive secondary schools being established in local districts which would attract pupils who do not now go to secondary schools of any sort?—Yes, I can perfectly imagine that.

14338. Is your point with regard to these demonstration farms this: that before new methods are adopted by farmers it is necessary that they should have seen them in two stages; first in the stage of experiment, and secondly in the stage of practical demonstration on the paying basis of an ordinary farm?—Practically, though I do not hold that it is necessary for them to see it in the experimental stages at all. Certainly they might like to see it in the experimental stage, but I really attach importance to the demonstration stage. In Perugia they find that it is the demonstration farm that excites the greatest interest amongst the farmers.

14339. It was suggested that the same result might be obtained by collecting the information and making calculations on existing ordinary farms as by having special farms under the authorities concerned. Do you not think there might be this difficulty in that scheme, that farmers are not willing generally that their methods and the cost of their methods should become public property?—I think that would be a very great difficulty indeed.

14340. But you do strongly hold that where all attempts to work in with an existing farm were not available, it would be a good expenditure of money for a county to acquire a demonstration farm?—I do consider that to be the case, though of course one would have to be so much guided by individual circumstances, and naturally if it was a case of doing it out of public money it would have to be done in the least speculative way possible, and if there were farms in the neighbourhood capable of becoming demonstration farms, and if there were landlords or farmers who were willing to lend their farms, and you can find such in various districts, then I think one ought to take advantage of such conditions.

14341. Do you believe there has been in the districts that you know such an increase of knowledge and experience of better methods of farming that demonstration farms of

Mr. O.
Turnor.
—
10 July, 1907.
—

that kind would really teach a great deal which it is not at present the custom for farmers in that district to adopt?—I believe that to be the case. I think that the attitude of mind on the part of the farmers has changed a great deal in the last few years, and I do think that their attitude towards scientific work and the necessity of the employment of the most up-to-date methods has changed very considerably within the last ten years.

14342. (*By Mr. Lamont.*) You mean that their attitude has changed in the direction of showing a greater desire for education and for improvement of method?—Precisely.

14343. Can you tell me from your experience in Belgium and Italy, the two countries to which you specially referred, whether you found a greater desire for education among the rural classes in those countries?—No. I could not say that at all, but I was hardly in a position to judge. There is a small group of keen landowners who were most progressive; in one case English instructors had been brought out to give nature study demonstrations.

14344. You think in this country the desire among farmers for further education would be fostered if it could be brought home to the farmers that such education was really of a more valuable and effective character?—Most certainly I believe that.

14345. And particularly if an agricultural bias were given in elementary schools?—Yes. That point was discussed at a Committee of the Lincolnshire Farmers' Union, and they came to the conclusion that I have arrived at and given to you.

14346. I dare say you remember a passage in a very clever book called "Mrs. Curgenwen of Curgenwen," that came out some time ago: to a lady having a conversation with the pig-boy on her farm, and asking what he intended to do in after life, he replied: "I have passed the seventh standard, and I intend to be a clerk in the Bank of England at £50 a year." Do you think that our system of elementary education tends to make all our pig-boys wish to become clerks in the Bank of England?—I think so decidedly—and very bad clerks too.

14347. Can you tell me whether the secondary schools in Belgium and Italy in rural districts are definitely divided into two classes, high schools for general education and agricultural secondary schools?—I am afraid I cannot tell you that; not knowing the language very well I missed a great many of the details. At the institute in Perugia I saw the course of nature study and the school gardens, and certain elementary schools, but the secondary schools I did not visit. I believe that is more the case in France.

14348. Yes, and in Denmark?—Yes, but about Italy I could not say.

14349. Your evidence rather led me to think you would agree with the adoption in this country of the Danish system in this matter, that in the ordinary secondary schools in rural districts a very distinct rural bias should be given instead of an urban bias, and that the history of land tenure of this and other countries should definitely be taught, even although there is no intention of the school being considered a practical agricultural school?—Absolutely. I quite agree.

14350. With regard to the lectures, you think that these at present are premature, shall I say, until a better system of elementary and secondary education has made the classes for which they are intended more receptive to the subject of the lectures?—Yes. I think it was beginning entirely at the wrong end, and that they are trying to begin at the top and work down without having a proper foundation and giving a proper bias in the first instance.

14351. That is entirely borne out by my own experience in Scotland?—Yes.

14352. (*By Professor Middleton.*) You refer in your *précis* to the sum of £150,000 being available in this country for agriculture?—I believe that is the total sum spent, including the amount spent locally on education definitely beneficial to agriculture.

14353. I think you will find that that is 50 per cent. too much?—I forget where I got that figure from. It is not as much as is spent in Ireland, I think.

14354. It weakens your argument to overstate the amount, and I wanted to ascertain where you got the figure from, because it is not correct as a matter of fact. —I really cannot remember at this minute where I got that figure from. I did not refer to the Blue Book as much as I ought to have done.

14355. The figure is roughly about £100,000. You have

been looking into the cost of education; are you satisfied with the return we have got for the sum that has been expended?—I do not think on the whole that I am, because I feel if that amount were directed primarily to the elementary and secondary side, without curtailing higher education we would do better even if for the moment the amount spent on lectures, continuation classes, &c., were reduced.

14356. You know, of course, that a very large proportion of this sum, about £84,000, is spent by the County Councils?—Yes.

14357. I think you represent the County Councils Association?—I do.

14358. I was wondering whether your Association are satisfied with the results of the County Council expenditure?—I think we take rather the attitude with regard to that that the Lincolnshire farmers take in their expressions of opinion by the Committee of the Farmers' Union, that there was not a sufficient bias towards agriculture in the elementary and secondary education, and that we would rather see that developed in the first case than the spending of an increased sum on lectures and continuation classes, or even developing the higher education, except in so far as it affects the increased holiday courses given to teachers. That we felt to be one of the points of most importance, to try and increase the number of teachers receiving direct agricultural instruction.

14359. I gather the Association is not quite satisfied with what has been done by the County Councils?—Certainly not. Taking the case as a whole, we feel that agricultural instruction ought to be developed much further than it has been.

14360. With regard to the demonstration farm that you have suggested for carrying out what you call commercial demonstrations, you admit, of course, that if you have a commercial end in view you must have the undertaking on a commercial scale?—Quite.

14361. This would mean that for even a single experiment you would probably require a very large farm?—You would.

14362. And therefore, even if we had established in a particular county a farm such as you indicate, it would not be able to deal with a very wide range of work?—It would deal with the average work of the locality. It would set up a standard that would be suitable for that locality, and I think it might very beneficially include two types of holdings—one for the large holder, and in view of the probable increase of small holdings, a demonstration small holding, which I believe is in the mind of the Board of Agriculture, and which I think is a very important thing.

14363. I am thinking more of the large holding, and I agree with you that it would be necessary, if it is to be a commercial success, to adapt it to a particular area, and the question is how large would that area be?—Yes.

14364. That, of course, introduces a difficulty?—It does. Of course, at first they would have to be much fewer than one would like to see; we could probably only begin with perhaps 10 throughout England.

14365. Would you not agree that weighing the relative advantages and disadvantages of demonstration farms, and of experiments conducted as the Chairman suggested on private estates, that it might be better perhaps to see what we could do on the private estates first?—I quite agree. I think both methods could be employed with advantage, where you could have complete demonstrations under a college it would be best, but on the other hand, there would be nothing against having as complete a demonstration as possible on any farm that could be put at the disposal of the agricultural college. I think it might work very well, but of course the question of capital would have to come in in any case.

14366. The object after all is to get the farmer to imitate you?—Quite.

14367. My feeling would be that the farmer might say even if he saw the thing carried out on a demonstration farm and saw it was a commercial success, he would argue that his position was different, that he could not afford to run any risks, and that as he would still have to experiment to a considerable extent, he would not alter his present methods at all?—Yes, but I think if you could show a farmer that by ploughing up bad grass and sowing lucerne (giving him full information as to the best methods of treatment) he would increase the yield of foodstuff manifold and also improve the condition of the land that he would follow suit.

Mr. C.
Turnor.
—
10 July, 1907.
—

14368. In that particular case probably he would?—I look upon the development of lucerne growing in England as a very important feature, but it is only one of the fodder crops, and I would like to see much more attention paid to fodder crops.

14369. Do you not think that experiments even if they are not on what one might call a commercial scale do give to the farmer hints which he very often carries out in practice, and makes a commercial success?—Some may take advantage of the results of experiments, but the great thing is to create tradition now, and undoubtedly experimental farms, as pure experiments, help to create tradition, with the more intelligent class of farmer, but I think the demonstration farm would do most good with the general average.

14370. My experience in connection with these demonstration plots is that I have frequently had people coming to me for hints as to what they might do in practice, and apparently they were quite prepared to accept the hints and to try whether they could, working under their own conditions make a commercial success?—Certainly there are such cases, but the question is what proportion of farmers would do that?

14371. I feel that probably about the same proportion would take the hint in the one case as in the other?—The only thing is do you not think that with the demonstration farm if you show you are making a clear profit of so much per acre, and that by treating crops in a certain way there is a larger margin of profit, it would be a much stronger hammer when done on the scale of a farm rather than on a plot.

14372. (By Mr. Latham.) I think you said you were farming something like 3,000 acres of land?—Yes.

14373. Naturally, we may take it, it is your own?—Yes.

14374. You have spoken with a good deal of feeling about the excellent way this foreign work was carried on. Have you thought it worth while to employ any foreigners to assist you in your occupation?—I had two ideas at one time, one was to employ a German expert, but I found that one could get an Englishman, or rather, he was a Scotchman, who was quite up to the standard of any German; and secondly for my demonstration of a small holding, I originally intended to bring over a Dane, but again I found a very intelligent labourer from the small holding district of Lincolnshire who is very much interested in the question as a problem. I have watched a good deal what they do abroad and I do not think it does to slavishly follow foreign precedent. What we want to do is to consider the question as a problem and see what we can work out on our own lines suitable for our own country.

14375. What I rather wanted to gather from you was this, whether you had seen such improved systems abroad that you would be conferring a benefit on society at large by bringing some of these men over and teaching us to farm in England like they farm abroad?—No, I would not go so far as that. I maintain that it is more for the general average farmer in this country. There are lots of very good farmers indeed, and lots of my own men have farms that are perfect models of what a farm ought to be. Those men are always ready to pick up any wrinkle coming from any source whatever, but I still think that in the large districts where we are sticking to our four year rotation, and in districts where turnips do not grow freely, that we could, with great advantage, substitute fodder crops for much of the root crop that is grown now, and also in other districts where they look to grass as a chief source of food for their cattle, I think reading the lesson taught by foreign cultivation that if we gave up our trust in grass very largely, and increased our belief in arable land for producing fodder crops, that we might do so with very great benefit. I think there is great misapprehension in England as to what crops do pay and as to what crops do not pay, and there are districts that I know where they think wheat cannot pay at all in spite of some very clear examples of wheat paying a very good margin of profit over the cost of cultivation.

14376. You have made a very strong appeal for State aid in your evidence here this morning, but being an agriculturist myself I almost feel that we should not be shown to be so dependent on State aid as you have suggested. Do you not think it is possible for us, as agriculturists, to carry out a great many of these experiments for ourselves?—I quite agree. I think we must do a great deal for ourselves; I want to see as much done as possible, but the principle of *laissez-faire, laissez-aller*, which did very well in the past, leaving everything to private enterprise

no longer answers in the twentieth century with its complicated civilisation. A considerable amount of State assistance on sound lines is necessary; there is a large amount of needful work which is either not being done by private individuals or not being done on a large enough scale. If we are to get agricultural education into the condition that we would all like to see it in, I think we will definitely have to receive much more consideration and aid from the State.

14377. Much as I should like to see great assistance to agriculture, I am so afraid that our large farming interest will feel rather sat upon by being shown that we so entirely depend on State aid for our business?—I do not think so more than in any other industry. Other industries are aided by very complete systems of technical education and have their technical schools that have very great bearing on the industries of particular districts. At Swindon, for example, you will see a great State-aided institution in which the boys going off to the Great Western Railway works can go through a special course of instruction bearing upon that industry, and my contention is that agriculture should have the same amount of State-aided instruction as is provided for other industries, and that local authorities should give a fair proportion of the money that is available for technical education to education that I shall call technical agricultural education.

14378. If you wish to alter the teaching in the elementary and secondary schools, are you willing to alter the Code?—I think the Code has been altering very considerably of late. The whole spirit is changing and the introduction written by Mr. Morant some three or four years ago, showed a very different spirit to anything that had appeared in the Code before—trying to show the aims and objects of education in general.

14379. That is not what I meant. Do you mean you would like it to be changed in the way of supplying more agricultural teaching?—Certainly, and that is what is being done in many schools to-day. It can be done under the existing Code perfectly easily; it is merely a question for the local authorities. I do not know whether you have seen the suggestions sent out by the Rural Educational Sub-Committee of the County Councils Association. Everything we recommend there can be carried out under the existing Code where the conditions are favourable.

14380. But the unfortunate thing is in regard to that, that the teachers are not competent to teach it?—That is so in a great many cases and one must only put in force such teaching where the teachers are capable, but we are trusting each year to having an increasing number of teachers who will be capable of giving that instruction, and to that end we are endeavouring to increase the number of teachers attending the holiday classes at the agricultural institutes and college.

14381. Are you in favour of the teaching in rural districts being quite different from what it is in urban districts?—That is a very big question. One can point to various urban schools where nature study is being taught to the very great advantage of the pupils, but I am primarily concerned myself with rural districts and, therefore, I say that we must have a rural bias to the education in rural districts. I am emphatic about that, as long as the bias will not be doing injustice to any of the pupils there who may want to go into town life afterwards.

14382. If you had that you would want two distinct sets of teachers, would you not?—I do not quite agree there. As I said in reply to Mr. Acland's question, I would like to see an extra course in the regular training of the teachers. In the training of teachers at the present minute in England, it is only in the third year that the standard approaches the present standard in Germany and France, and I would like to see incorporated in the third year's course a certain amount of agriculture that might enable them to teach nature study. In cases where they were not competent to teach nature study, we must develop the system of peripatetic teachers.

14383. With regard to the secondary schools, I think you spoke of agricultural sides being added to them. Do you think that that would be beneficial?—I do, most certainly in schools to which the sons of agriculturists go, because I maintain, having gone through a certain amount of scientific work myself, that it is the directly practical side that has stayed with me and has been of the most value. What is the good of learning abstract chemistry? I forget the book I read a lot, but there were 1,400 pages, and when I went in for the Royal Agricultural Society's examination, I knew enough of chemistry to set

Mr. C.
Turnor.

10 July, 1907.

up as a chemist, but it has done me little good, and a 300 or a 400 page book on agricultural chemistry, chemistry as applied directly to agriculture, would stay with one and enable one to understand the processes going on in a way that pure chemistry does not do. That raises the question of how much general chemistry ought to be taught. My view is that very little is necessary and that agricultural chemistry is all that is required.

14384. You would not class yourself as a farmer's son?—I have never attended a secondary school or a grammar school, but I do maintain that a very useful amount of agricultural chemistry could be taught at such a school. We do not want to turn the farmers' sons into chemists but to interest them rather in the agricultural processes that go on, and it does not take very many hundred pages or very many hours of instruction to give a certain understanding of chemistry.

14385. Would you not rather favour a general education at the secondary school and then let the lad go for two or three years on a farm and go to the college short courses after that?—I would like him to go to the farm because the practical work can only be taught on the farm, and I would like to see him go through either short courses or a year at a college, but his interest should be first roused in the secondary school.

14386. Do you not think he would find out what he wanted in the way of scientific knowledge if he had first had two or three years on the farm and then went back to the college short courses?—I quite agree with you. One ought always to have the practical work first; and then the scientific or theoretical work. You see that in France carried out hand in hand very well. You will see it carried out in the elementary schools—I do not know about the secondary—and the pupils, after their morning lesson, go out and join their parents in the fields in certain places and have their lunch with them and do practical work in the fields.

14387. (By Mr. Medd.) That is not universal?—In certain districts it is done.

14388. Yes; but I think you may practically say that half-time schools in that sense have been discontinued during the last two years?—Yes, but it is still done in certain districts.

14389. (By Mr. Latham.) If a lad goes home for two or three years and gets a little information of the practical work, he can then go back to college and find out what is absolutely necessary for him to learn in the way of scientific knowledge and not that he should receive this high-class education which would make him unfit for being a farmer afterwards probably?—I am always against what is called a high-class education. I want it absolutely directed towards the one aim and object—to develop the intelligence as quickly as possible, to have it concrete rather than abstract, to have it from the hand to the eye and to the brain with the final objective to make the boy think for himself and to think correctly. I am of opinion that it is necessary to give that bias in the elementary schools first, otherwise you will find if the boys have simply been through a dead rote of text books—you see it every day—the text book work simply deadens their intelligence and many of them go back on to the farms without taking any living interest in any single subject connected with agriculture.

14390. Do you find in Lincolnshire a large proportion of farmers' sons are likely to become farmers?—Yes, in my own experience they do; they go on from father to son.

14391. Is there a large proportion of young men in the several schools that are likely to go into farming?—I should say so; I really have not gone into that, but I should say so.

14392. Is this teaching likely to make more men go into farming do you think?—I hope, primarily, that this type of education will induce more labourers' sons to go in for farming. Take a school I am thinking of now that has just started school gardens; the schoolmaster has turned out 1,000 boys, some holding very good positions in different parts of the world, some doing pretty well near by, and a much larger percentage of the 1,000 would have stayed in the country if there had been the facilities. If you first rouse their interests when they are at school in agriculture, and then give them the opportunities that small holdings will give them to stay on the land, I think you will certainly get a vastly larger number of people making their living directly from the land; and increasing that class is of very great importance, because they in turn when their sons grow up will provide young men for work on the bigger

farms for a certain number of years, until when the rotation comes round they are able to go on to their father's holding, or to have another little holding of their own.

14393. You have said a good deal about lectures and you think they are almost a failure?—I would not say almost a failure, but I do think they would be much more effective if the interest was aroused in scientific work first by other means.

14394. These lectures are not all obliged to be scientific?—No, I used the word "scientific" rather loosely there, because even as practical demonstrations of methods or expatiations of modern methods, I think they would be much more effective if the boys had had, even as far as the elementary school goes, their interest aroused, and if they had been doing certain work in a school garden, and got to a certain stage, and they heard a very good lecturer was coming, they would naturally be keen about listening to the man, and they probably would make notes and really profit by it, but at the present moment they go in, and having had no previous thought on the subject of what the lecturer is going to lecture about, their minds are not in a state to benefit by the lecture, and the probability is that if they go at all they will not benefit very much.

14395. Has not the fault been with the lecturer, and not with the lectures so much?—Unfortunately it has been so, because many county councils have sent out lecturers that did infinitely more harm than good.

14396. I suppose up to the present time they have been very difficult to get?—Very.

14397. Has the number of agricultural students largely increased lately?—That I cannot tell you.

14398. Has the anxiety to become agricultural students increased?—Of course one can only speak of one's own district. I cannot even say there that I know of an increased number of cases of youths wanting to become pupils, but I can say emphatically that the farmer much more widely recognises the importance of increased agricultural education if it is on sound lines.

14399. You say in your *précis* that college students you consider make certainly the best farmers?—In the cases that I have observed that was so, but they were the sons of excellent farmers to begin with. I believe very generally they considered that they derived very direct advantage from colleges, and all that I can say is the definite fact in the neighbourhood I am thinking of is that the men who have been through that course are the best farmers in the district for promptness and business methods. I have ridden over the farms with many of them and they are a tremendous lot ahead of the average.

14400. Is that by reason of their fathers having been excellent farmers, or is it because of the scientific education they have had?—When you come down to that it is very hard to say. You must give a great deal of credit to that, and undoubtedly they were very sharp men to start with, and probably very good organisers at the same time. No amount of scientific education is going to make a farmer succeed unless he is a good organiser.

14401. With regard to the "hearthrug" experiments that you mentioned, these experiments necessarily must be on very small plots?—Yes.

14402. Is there really any very great feeling against an experiment that is carried out on a small scale?—I do not think there is any great feeling against it. My point is that the "hearthrug" plot is very useful for Rothamsted and certain other definite centres for research, which must go on in that way, and I would like to see more experiments of the "hearthrug" kind for providing data for other people to carry out on a larger scale.

14403. You think the forerunner of the commercial experiment should be the "hearthrug" experiment?—You want an intermediate demonstration between the "hearthrug" experiment and the farmer.

14404. Is not that a great waste of time?—I do not think so, because I think they are wasting their time in many districts by not availing themselves of ascertained facts. Of course there is always the up-to-date farmer who takes up a new idea or two; but if there were a demonstration farm consolidating into a complete system suited to the locality the truths discovered at research stations, I think a much larger number of average farmers would be induced to follow.

14405. My experience is that we are not so very much shut in in our occupations, and I think most of our neighbours know exactly what his neighbour is doing?—I must say my experience is rather different from that. I have been surprised myself at it, but the fact remains. I have

Mr. C.
Turnor.
—
10 July, 1907.
—

given you the case of the barley experiments in Lincolnshire where the increase per acre in every case of a 21s. dressing of artificials as applied by Mr. Murray was repaid with anything up to 50, 60 or 70 per cent. increase. Those experiments went on for five years, and had no effect whatsoever upon the local farmers. In fact one very big farmer got as far as the fence and said, "I do not see that this expert from the Midlands can teach us much about barley growing," and he never once enquired what had happened. All the results are recorded in the Midland Institute, and those farmers who did follow in the same direction found very great beneficial results to themselves. In any movement like this one must actually put it before the farmers themselves.

14406. I quite agree, but in all probability was it not because they formed conclusions that it would not be beneficial to themselves?—I do not think they really formed any such conclusions. I do not think they knew about the definite results at all.

14407. You made a remark about Mr. Prout. I know him very well, and I went to see his occupation, and I followed suit immediately I went down there, and I get a great many people to come over my land and see what I am doing?—Yes, and Mr. Prout got a very great many people over his land too, but when it comes down to any definite neighbourhood you see what a small percentage have followed his example.

14408. Yes, but why should the Government take this up. I think individuals ought to?—I look upon it as completing the whole scheme of the educational course, you lead in stages right up to that and that is really a finishing touch to the whole educational scheme. If you can get individuals to take it up well and good, but I think the great difficulty about keeping records ordinarily will stop individuals doing that. I know I have been trying very hard to get data about various things from various farmers, and I have found the greatest difficulty. One Norfolk farmer only the other day sent me very interesting data of all his working accounts, but there are not so very many that can do that.

14409. I can recollect the time when such a thing as a register in a diary was almost unknown, but nearly all farmers keep registers now?—They do more generally.

14410. That is brought about by meeting one another at farmer's clubs, and on market days, and in various ways, —Undoubtedly, but my point is when you are carrying out scientific experiments, experiments involving a good deal of chemistry and chemical terms, then one farmer would find it rather hard to describe it to another farmer, and if it is done under the auspices of one of these institutes, and is put clearly before the farmers of the locality by that institute, that then the chances might be much better of its being taken up, provided that it is put clearly and simply before them.

14411. With regard to a State experimental farm, do you not think it would rather do us harm than otherwise if we were to recommend such a scheme?—I must say I cannot see that. I think you want to encourage individual effort in every possible way, but I feel at the present time that individual effort is not very active throughout the country, and if in every county you saw several of these farms that could be called demonstration farms, run privately, then I would say nothing more about it; but, unfortunately, that is not the case, and we want to show how to increase the production per acre, and how to buy and apply the artificials most economically. For instance, I mentioned the case of the farmer who had been buying soot at 30s. a ton. He is a man who gets a great deal out of his land, but the amount of nitrates contained in soot is so small that though he thought he was buying it very cheaply, as a matter of fact, he was paying 50 per cent. more for nitrate of soda in that form than he would have paid if he had bought a hundredweight and a half of pure nitrate of soda.

14412. You do not want to make farmers chemists?—No; he wants someone who can supply him with the chemical knowledge. Farmers must in the main keep to practical work, and not be chemists or analysts themselves; but do let us avail ourselves to the utmost of expert scientific advice, which I would like to see provided locally, and I contend that the demonstration farm would be of great assistance in that way, and I would like to see all the information collected being utilised by the farmers in their methods, and with regard to the buying of food stuffs and artificials, and the applying of them, and so on.

14413. (By Lord Barnard.) You will agree with one witness who came before us, who did not believe in teaching farmers at great work and trouble what could be done by

a professional man for 10s. for the farmer?—I agree with that, but what one requires is early education to develop in the farmers' sons sufficient interest in progressive agriculture to make him anxious to utilise the services of that expert.

14414. (By Mr. Latham.) I was just going to ask you that question, but Lord Barnard took the words out of my mouth. Should you be surprised to hear that we have had professional men here who deprecate that kind of thing very much indeed?—I do not quite follow. What type of professional man?

14415. There is a certain profession of analysts, we will call them, who consider that this cheap way of getting analyses made is detrimental to themselves, and it is detrimental to ourselves also?—I do not think it is detrimental to ourselves; it may be detrimental to the analyst.

14416. Is it done as well by these men at colleges who are not analysts as it would be done by an analyst?—The question of analysing butter, for example, is a very delicate operation, and there ought to be a very competent analyst for that. I employ an expert who would be quite capable of analysing, but I have not got the apparatus for analysing, and I do use, as a matter of fact, the public analysts. I very often send things to Wye to be analysed, and I do not think there need be any apprehension on that score, because I think the tendency will be for local analysts to increase in number. You see that now the different Farmers' Associations are retaining analysts more or less of their own.

14417. Your remark would apply more than ever to artificial manures?—Quite. I think everything ought to be subjected to the analyst, and it has most excellent results, and I can speak to a number of cases from my own experience.

14418. Now with regard to the cattle feeding and weighing and measuring, have you had any experience at all in that?—I have not gone to the expense of a weigh-bridge of my own. I have not got down to weighing every day or every week, but I weigh when the cattle get on to a certain type of food, and I weigh at the end of the time.

14419. Do you think that is a thing we could ask for Government aid to assist us in?—Not specifically in the weighing of cattle. I could not specifically go into details and say there should be Government aid for this and Government aid for that. I put it as part of the whole system, and that equal facilities should be given to agriculture as are given to other industries. But I think at a demonstration farm that it should be one of the most important experiments—certain food costing so much a day has put on so many pounds of flesh, because you might be feeding with one combination which costs you 3d. per day per pound gain, whereas in another combination of food stuffs they might do equally well on what was only costing you 1½d. per day.

14420. Do you know the Woburn Farm at all?—No, I have not been there.

14421. That is done by the good feeling of the Duke of Bedford?—Quite.

14422. Do you not think it would be enough for us to trust to such enterprise without going to the Government?—I do not think it is doing sufficient. That is my point: that we ought to have more of such work throughout the country.

14423. Something very similar to what you have been suggesting is carried out at Woburn at the present day?—Yes, I believe that is so. Undoubtedly Woburn is having a very beneficial effect and influence in the immediate locality but still I should like to see more of these centres. I only suggest that it should be done under Government because I see no prospect of it being done by private enterprise. After all, the number of these demonstrations now in existence in England are not, to my mind, sufficient. I am myself in a way carrying out what amounts to a demonstration farm, and I am doing it purely from the commercial point of view, on farms that we could not let before, and upon which there has been a heavy loss, land that was farmed on the best of the old accepted fashion, four-yearly rotation, and I am simply trying to devise some method by which they can be improved and made to pay.

14424. This next question I do not want you to answer if you do not wish to. Do not you think, as a landlord, when you talk about the four-course rotation, that that system has been forced on the tenants by the landlords?—Yes, I absolutely agree with you. I am in favour of freedom of cropping providing the land is used properly, and not abused. Of course, now there is the freedom of

cropping, and I have had many farmers say to me, before the last Bill was brought in, that they would have tried many new crops if they had been at liberty to do it. There is still the difficulty of valuation at the present moment, and they were afraid of trying new crops for fear of breaking the local system of cropping, and in case they had died and left their executors in a muddle.

14425. You made a remark just now that the new methods were very successful. Is not that very much on the lines I am speaking of? Certain new methods of farming have got into operation by farmers having their hands less tied?—I quite agree.

14426. Do you think that will apply all round to agriculture?—I think it will, but I think they will be immensely helped if a system of expert advice were developed all through the country. Now there is freedom of cropping, and an increased inclination on the part of the farmers to try new methods and new treatment, if they had the demonstration provided for them instead of their having to get data for themselves, it would be a great advantage.

14427. I think you were here this morning when the last witness gave his evidence?—Yes.

14428. Do you not think if we made a stronger feature of the question of research, and that sort of thing, we should have a much better chance of improvement than by going into these other details?—I quite agree, but I feel very strongly that we want the two. I would like to see many more centres of research instituted, and a great deal more money spent on research.

14429. After all, the great depression that has gone on with regard to agriculture has prevented farming being in anything like the flourishing state it ought to be?—Quite.

14430. (*By Mr. Davies.*) You have pressed upon the Committee the importance of an agricultural bias in the early stages of education. We had a witness here a few days ago who told us that in New Zealand they attempted to bring nature study into the schools there with the object of inducing, if possible, children in towns to go into the country and to take up agriculture as their life pursuit?—Yes.

14431. Would you think, if that policy was adopted in this country by the Board of Education and by the authorities, that it would produce some result of that kind?—I think it would, undoubtedly, if the facilities for getting on to the land were developed hand in hand, as they probably will be under the Small Holdings Bill.

14432. You think it would almost revolutionise, or, at any rate, do something to stem the flow off the land?—I think it would do more to stem the depopulation of the land than anything, and I think it is to the rising generation we must look rather than to the older generation. My experience is, in most cases, that there are quite a large number of men who would like small holdings at this minute if they could get them in suitable places and not in places where any man of common sense would see at once that a small holding would fail.

14433. Would you like to see it compulsory on elementary school teachers to go through a course of nature study?—I would like to see all elementary school teachers take up a course of nature study, because I consider it is a valuable way of training the brain.

14434. You would make it compulsory?—I would.

14435. You told the Committee that farmers found it very difficult to understand and reap any benefit from the periodicals and reports issued by the various colleges with regard to experiments?—Yes.

14436. Would they find any difficulty in understanding the leaflets circulated by the Board of Agriculture?—I think not, and I think in many cases the Board of Agriculture leaflets are being used more and more. In my own case I find the foremen are really quite keen on reading them, and they have no difficulty at all in understanding them, and I would like to see very many more. I believe it has been developed very much in the last few years.

14437. Do you find they actually reach the hands of the small farmer?—That I cannot tell you. Wherever I have noticed the publications in my own part of Lincolnshire they have been obtained either by myself or the agent or the expert writing to the Board for pamphlets on definite subjects, and then we have handed on the advice and literature that we have received.

14438. Have you any suggestion to make as to how the literature could be more widely distributed, through the medium of post-offices or means of that description?—I have not thought of that at all yet, but I certainly think it

ought to be more widely distributed. It might be done through the schools perhaps, but that is only a passing idea.

14439. With regard to the overlapping which exists in experiments, do you favour the idea that there should be some sort of central Committee organised for co-ordinating the results of the different experiments carried out in various parts of the country?—I quite agree with that idea.

14440. Is there any provision made for agricultural circulating libraries in your part of the country?—No.

14441. Do you think it would be a good thing if Government or the local authorities were to spend money in that direction?—I think that is certainly work that the local authority might most easily take up.

14442. Should you think students and probably short course students and farmers keen on agriculture would make use of circulating libraries of that kind?—Yes, I think they might. Of course it is very hard to say. It is difficult to get people to read in any line of life. The twentieth century is not conducive to reading very much.

14443. Except magazines?—Except magazines.

14444. (*By Mr. Medd.*) I think you had considerable experience of the Education Committee of the Royal at the Lincoln Show?—Yes.

14445. In fact you presided at one of the meetings?—Yes.

14446. There was a very large interest taken in the whole of the proceedings?—There was.

14447. You had a very large attendance of teachers?—Yes.

14448. In fact it formed one of the most prominent features of the show?—It certainly did.

14449. At present it is taken up by the Committee of which you and I happen to be members?—Yes.

14450. Perhaps you will agree with me that it would be better if in future the Education Committee of the Royal would become responsible for the whole of it?—I quite agree there. I think they ought to recognise it as one of the important parts.

14451. I have discussed it with Lord Moreton, and probably you have yourself?—Yes.

14452. With regard to the type of rural school suggested, have you ever heard there by any responsible person any suggestion of making it an agricultural school?—No.

14453. The type of school you desire for the rural districts is identical with the type of school for the urban districts?—It is, so far.

14454. The mind of the child is to be as far as possible directed to natural and physical phenomena to develop intelligence of mind and powers of observation?—Exactly.

14455. Those faculties are just as valuable to the urban child as they are to the country child?—Absolutely.

14456. Probably you will agree with me that the same principle applies in regard to secondary schools?—Yes.

14457. That the object of an agricultural bias in secondary schools as in elementary schools is to develop above all intelligence by observation?—Quite.

14458. It follows that there is no necessity to develop secondary schools of a rural type, or rather with a rural side in rural districts?—Not if the existing schools can be given a sufficiently agricultural leaning.

14459. You have not had the opportunity yet of seeing such a school?—Not yet.

14460. I shall be seeing Mr. Hobhouse in a day or two and I will ask him to invite you down?—I should much like to go.

14461. If you went down to Beckford you would see a school conducted entirely on the intellectual methods with respect to agricultural and rural interest, attended by children who ride and drive some of them eight or ten miles daily to it—a school in a remote village. That is the school we want for those who can go to a secondary school?—Quite.

14462. Have you come across any school of a higher elementary type in Lincolnshire?—No.

14463. Have you visited an *école primaire supérieure* in France?—No, I never have.

14464. You were speaking just now of those children who must become workers almost as soon as their elementary instruction is over?—Yes.

Mr. C.
Turner.

10 July, 1907.

Mr. C.
Turnor.
—
10 July, 1907.
—

14465. Do not you think that we could establish central schools, I may call them, of a higher elementary type in suitable rural districts providing commercial, industrial, and agricultural instruction? They would supply the kind of education that the young farmer wants?—I think they might.

14466. You have not actually seen that type of school?—No, I have not. I hope to study them later.

14467. You feel that the money now given by the Board of Agriculture is to some extent wasted?—I do.

14468. That there might, in other words, be a wiser distribution of it. I do not know whether you would agree with me that there might be a fairer distribution of it?—Do you mean on the question of grants?

14469. Yes. You feel that the money might be distributed possibly to better advantage and with less waste?—Of course, as regards the question of actual technical distribution of grants, I really have not studied the Blue Book at all. I believe my fellow representative is going into that side of the question.

14470. This morning you spoke of different grades of institutions. Do you not think it possible that some of those red spots such as Reading and Bangor and Harper-Adams are re-duplicating each other; that there is possibly not a sufficient supply of pupils for so many schools of that particular type?—I should think at the present moment—I am only giving an off-hand opinion—that that possibly might be the case until the demand is increased by previous education.

14471. This is an idea purely of my own: Do you think it would be more to the advantage of agriculture if the Board of Agriculture were to allocate a fixed sum annually to the County Councils, subject to the submission by each county of a scheme of agricultural education in the way that the Board of Agriculture approves of and gives grants?—Yes.

14472. You are aware that the tendency of the local authorities is to detract from the "whisky money" formerly spent on agricultural education owing to the demand for the training of teachers?—Quite.

14473. If the result of our report were to cause the combined grants from the Board of Agriculture and the local authorities to exceed £100,000, and if these grants were distributed entirely by the Board to each county after the submission of their schemes, do you not consider that more overlapping could be avoided, more waste prevented and a better organisation instituted?—That is rather a hard question to answer. Really I hardly feel competent to answer that, but I feel that if a definite scheme were made and put down on paper, also a definite system of control of that agricultural education, that then overlapping could be avoided.

14474. What one is aiming at is organisation and systematization, and from each witness we have had the most satisfactory answer that he is prepared to co-operate fully with his neighbours. If we can get the Board of Agriculture as the definite centre, instead of

saying to each county, "You will have so much out of the whisky grant," and leaving it to that county to allocate so much to agriculture, it would be better, would it not, for the Board to be the centre, endowed with £100,000 a year for agricultural purposes, or more if necessary, and earmarking so much to Kent, for example, and so much to the next county, and so on?—Yes, I think that might work very well. That sounds a very good suggestion.

14475. Take all that question out of the hands of the Board of Education altogether, and do not have this constant struggle?—The local authority would be responsible for the carrying out of the purpose for which the money was allocated?

14476. Yes. Of course there is the inevitable relationship of the Board of Education to the Board of Agriculture about which you spoke?—Yes.

14477. You would prefer, I take it, that the elementary school work should remain wholly in the hands of the Board of Education?—I cannot see how it very well could be otherwise.

14478. The continuation schools which relate to agriculture should be controlled and subsidised by the Board of Agriculture?—I have only sketched out the three possible ways that I have heard put forward of arranging the control of agricultural education. Of course, in the case of Scotland, where the Board of Education has complete control, I am not at all competent to speak, because I have not studied the question. I only take the ground that I want to see as much money given to agricultural education as possible.

14479. In regard to the training of teachers do you make any provision in Lincolnshire?—We do in Lindsey, but, I am sorry to say, that Kesteven, at present, makes no provision for sending teachers to the Midland Institute, and I hope that Lindsey will send still more.

14480. (*By Lord Barnard.*) Have you land in Kesteven?—Yes.

14481. Can you tell us why they do nothing?—I think it is simply due to inertia and the question of cost. That is my solution of it. What they may think about that I do not know.

14482. (*By Mr. Medd.*) The proposition is shortly to allow trained teachers of not less than four years' standing to have a third year's training at some institution?—I have heard about that.

14483. I do not know whether you would bring that to the notice of your County Council as soon as the regulations are issued?—I will.

14484. Are you aware that there may be some difficulty if you do not give a teacher so trained some little extra salary?—Quite.

14485. He or she so trained you would feel, probably, would be competent to undertake the responsible work either as a peripatetic teacher or as a teacher in a higher grade school. At present the institutions are Swanley and Wye. At Wye there is a difficulty about residence at present, but if Wye will not take them Reading will?—Yes.

Mr. J. A. SMITH called and examined.

Mr. J. A.
Smith.
—

14486. (*By Lord Barnard.*) You are Principal of the Eastern Counties Dairy Institute?—Yes, under a representative Committee.

14487. What does that Committee represent?—It represents the counties of East and West Suffolk, Norfolk, the Isle of Ely, and the Borough of Ipswich.

14488. Your Committee has representatives of all those counties?—Yes.

14489. How long have you held your present appointment?—We commenced in 1888, first of all with assistance from the Agricultural Department of the Privy Council, before the Board of Agriculture was formed.

14490. You have been there since 1888?—Yes.

14491. So that the Institute has been going on for nearly 20 years?—That is so.

14492. How are the funds for the Institute provided?—We receive a grant of £300 from the Board of Agriculture and the funds are mainly provided by the various County Councils, and there are scholarships for certain students and fees from others.

14493. Have you any resident students?—Yes, we have about 80 resident students annually at our central Institute at Ipswich, and we occupy and farm about 350 acres of land.

14494. What does your Institute consist of?—A block of buildings erected specially for the purpose of giving instruction in dairying and poultry keeping principally.

14495. To whom do the buildings belong?—To the Institute.

14496. Who purchased them, do you know?—We built them ourselves. The Institute built them.

14497. From what sources did the funds come?—They were provided by about 70 or 80 land owners in the district.

14498. It did not come out of public money?—No.

14499. The funds for purchasing the land and erecting the buildings were provided by private subscription, and the Institute is now maintained by grants from local authorities and the Government?—Yes, and the fees from some of the students.

14500. I think this report, with which you are probably

familiar, contains a pretty thorough account of the curriculum of the work which you carry on, which is, in many respects, similar to that carried on by other counties?—Yes, on very similar lines.

14501. With which you are, perhaps, familiar?—Yes.

14502. Therefore, we need not go over that, but we should like to hear any suggestions you have to make or any points to which you would like to draw our attention, in which you think your Institute is doing specially good work, or points where you think your Institute might be improved. In the first place, take the work you do. Is there anything you do which might with advantage be done elsewhere which is not done elsewhere?—As regards the subjects taught, though we have these farms and keep from 30 to 40 cows, our principal work is devoted to butter making and cheese making, and milk testing, and we have certain definite courses in poultry keeping and poultry management. Most of the students come to us by aid of scholarships from the different County Councils, and there—
14502a as I go along, if I can suggest defects in the system—it is that we should much prefer something definite as regards these scholarships. We should prefer that each of the counties would give them for the same period, and that they should give a definite number every year. As it is now there is a very great uncertainty, and each of the counties that we principally work in connection with, Norfolk and East and West Suffolk, pursue a different system in many ways, and there seems to be rather an objection to work alike. If one county adopts one system
14502b another county seems to like to adopt a different one. I think the agricultural education of the county of Norfolk appears to be the best by far in the east of England. The money they spend on agricultural education is better applied and they get better results than in any other county; there is more elasticity about their system, and the central idea is to gradually help those who are inclined to help themselves. This is their scheme. (*Handing*
14502c *document.*) I will leave a copy of that with you. Another difficulty we meet with is this. Undoubtedly, there is a very strong feeling in all of the Committees to hoard up the “whisky money,” and there is a great disinclination to spend it. That has been more marked, I think, in East and West Suffolk than it has in Norfolk.

14503. Has there been in the case of any of the three counties principally concerned any decrease of their assistance to the Institute?—No, I think not. It has varied from time to time. That has been the last year there has been rather a tendency to increase it.

14504. Is the finance entirely in your hands subject to the committee, of course?—Yes, subject to the committee. I may tell you that ours is very up-hill work indeed. We want funds very badly.

14505. You keep books and so on?—Yes.

14506. Who draw the cheques?—The committee draw the cheques.

14507. You go to the committee with requisitions for the cheques?—Yes.

14508. What is the staff?—The resident staff is two teachers regularly, one a peripatetic teacher, and then we have a poultry teacher at certain definite periods.

14509. (*By Mr. Latham.*) Have you not two poultry teachers?—No, only one. Mr. Rentoul came because the other teacher was not able to come at that particular date.

14510. (*By Lord Barnard.*) Will you tell us what the length of the course is?—The course is generally five weeks for dairy students, but in Norfolk they have two courses, one of a fortnight for butter-making students, and one of a month for butter and cheese making. In my opinion it would be a very great improvement if the fortnight was changed into three weeks, and the four weeks into five—the periods are not long enough—and the poultry course of three weeks increased to four weeks. That has been done at Reading for a long time, and I am quite certain we try to “cram” too much into the students in the three weeks’ course. You will excuse my using the word because we apply that to poultry also. I have mentioned that to the committee and they say they will consider it.

14511. If your managing committee contains representatives of the two or three counties I wonder when they go back to their own counties they do not tell their Councils what the deficiencies are?—Quite so, but they are not all
14511a powerful. They have made representations, and that is as far as they can go. I do not wish it to be said that I come here to find fault. I merely mention this because I think you would like the information. I do not think

our courses have been a failure. I only point out how I think they might be improved. The tendency on the part of the County Council is that a short course or two short courses is sufficient. Then again with regard to the question of scholarships I find fault with the Norfolk County Council because they put this question to all applicants for scholarships: “What are your circumstances? Can you afford to pay your own expenses?” I venture to think that is a mistake. I do not know where the idea was derived from that poverty was to be a qualification for a scholarship. I think the peer and the peasant stand in the same position with regard to a scholarship for technical instruction, and I think it is very unfortunate that a question of that kind is put. I think the asking of that question has kept several away that we ought to have had, and it also rather lowers the status of the scholarship work, because we get a less educated person, and I may tell you that my own experience is that it is a very great difficulty with us, the want of proper education in those that are sent, frequently. We do not wish to exclude them, but frequently we have students sent to us who really are not able to write an examination paper.

14512. What age are they generally when they come to you?—Generally 15; not under 14 because they would not be eligible.

14513. Have any of them been to secondary schools?—That is a question that we ask them now, but from my personal knowledge I know that comparatively few have been to secondary schools.

14514. They are of both sexes?—Yes, but mostly females.

14515. Do both the boys and the girls live in the same building?—No, we have none in the building. We have a register of approved lodgings.

14516. Do you find any difficulty in that, in having young lads and girls lodging together in that way?—They do not lodge in the same house. They are all separate, but we have very few lads.

14517. Even if there was only one sex do you never have any trouble with regard to discipline or matters of that kind?—No, we never have any trouble; for one reason, because the students that come are not all of the same class, and are not all of the same age, and perhaps two or three like to associate together, but the others do not. We have carefully considered the matter, and we think the present system better than having a resident hostel.

14518. Some of the students come without scholarships and pay their own fees?—Yes.

14519. What is that fee?—The fee for a full course for the month is £5, and, for butter making only, 10s. 6d. a week.

14520. Your operations are limited to the two departments, dairying and poultry?—Yes. When I say limited, the farm, of course, enables us to teach milking, but milking is an optional subject. Many of the students wish to learn milking and they are allowed to do so.

14521. Is it all practical work?—No; practical and theoretical. Theory is usually taken in the afternoons and practical work in the mornings.

14522. Who gives the theory work?—The teachers.

14523. Do you give instruction in chemistry?—Yes; elementary work at the dairy, and we have also the run of the town laboratories, and we have had special classes there, but again the difficulty comes in of the want of elementary and secondary education in those that come to us. There are very few of them who are able to take a course of dairy chemistry such as we have arranged at the town laboratories.

14524. Does every student who passes through the Institute go through an examination?—They have the opportunity of doing so. I do not say that all who come for a fortnight have an examination. We do not have an examination once a fortnight.

14525. It is entirely optional whether they are examined or not?—Yes. If they wish for an examination they sit for it.

14526. Do many of them come up for examination?—Yes, a great many of them.

14527. Do any of them get a certificate or a diploma?—That is a separate examination at the end of the year, carried out by a stranger, and certificates are given, but that is rather a stiff examination, and only those who have had a good education can pass it.

14528. What becomes of these men and women, do you know, after they pass out of your Institute?—Most of them engage in work in their own homes, some of them get married and take dairies of their own, and some go out

—

into situations. In fact we have a very great demand for dairy experts and dairy servants, and we are constantly supplying them to land owners and land agents and farmers.

14529. (*By Mr. Latham.*) Are your students as a rule poorly educated?—I am afraid many of them are. Many of them are daughters of small farmers or tradesmen, and I think that the rule in Norfolk about asking the question about their circumstances has a great deal to answer for in that way. I think it is a great mistake excluding those who are in a better position.

14530. Are we to take it for granted that the farmers' children in Norfolk are badly educated?—No; I think the Norfolk farmers as a rule—those who hold considerable quantities of land in Norfolk—are perhaps the best farmers in the world and their children are well educated; but the small farmers' children, I am afraid, have had a very poor education.

14531. Are there no secondary schools in Norfolk where these young people can improve their education?—I am afraid the secondary schools in the Eastern Counties are very deficient. I think the arrangements in Norfolk up to the present have been unsatisfactory, and the small peasant farmers, it appears, have been hardly able hitherto to afford the expense of a secondary school.

(Professor MIDDLETON in the Chair.)

14532. (*By Professor Middleton.*) What do you wish to say about research work?—On that question, generally, I consider a great deal has been done in the matter of agricultural education, perhaps all that one can expect with the means the Board of Agriculture have had at their disposal, but not sufficient considering how far the development is required and how far it is absolutely necessary. The Board of Education, I must admit, have held out a hand towards agriculture and have done a very great deal throughout the last few years to help on agricultural education. Their Code has greatly improved in its appearance towards agriculture, and I believe they are very anxious to do what they can to assist, and as a matter of fact they have assisted us lately. I think they have encouraged the county committees to do something by way of evening classes, and each of the counties have had a small grant made to them lately; they have earned a small sum during the last few years in connection with their classes.

14533. That is purely educational work?—Yes. I will come to the matter of research presently. What I respectfully suggest is that the Board of Agriculture ought to be provided with far larger funds for this purpose, and then I think there ought to be a County Agricultural Committee elected direct from the County Council. As it is now, the educational work is delegated to a sub-committee of the Education Committee, and that sub-committee has to meet and report to the Education Committee, and it is put in a secondary position. I think the Agricultural Committee ought to be a committee elected on purpose for their work by the County Council, and I would suggest with regard to each of those committees, that the secretary to the county agricultural association and the secretary to the chamber of agriculture ought to be members of a committee like that.

14534. (*By Mr. Latham.*) Co-opted?—Co-opted—those two at any rate, if not others. To revert to the question of scholarships again, I think the qualification for a scholarship ought to be carefully considered by each county and on no account to have the poverty qualification. I am not sure the time has not come when some examination should be imposed. I think sooner or later some examination ought to be imposed on those who qualify for scholarships. In the case of Norfolk, I have already mentioned there is a practical examination held publicly once a year for the £8 scholarships given by the Norfolk County Council.

14535. (*By Professor Middleton.*) You are of opinion that longer courses are desirable, I see?—Yes; that I have already pointed out. At the very least there should be a three weeks' course for butter making and a five weeks' course for dairying generally, and four weeks for the poultry course. In my opinion those are the lowest periods that should be adopted. I should like to see them myself longer, but those are the lowest. As regards research work, I would like to suggest that it is a great mistake to consider research work as completed. I do not know that it ever will be completed; there are questions that are constantly arising. I should like to mention just one: we are urged and we are all trying to develop the cow as much as we possibly can, to give as much milk as possible and for as long a period as possible. We are imposing

unnatural conditions to a certain extent; we are trying to force Nature and in that way a new difficulty has arisen, namely, parturient apoplexy. The Board have issued a most valuable leaflet on that subject, but we do not know all that we ought to know with regard to it yet. During the last few weeks it has been terribly prevalent in the Eastern Counties. When I went down to the county show I had 14 cases brought before my notice, and three veterinary surgeons that I know were all of them run off their legs attending cases. I suggest that that is one direction in which research is further required. Then there is the case of epizootic abortion. That was investigated by the Royal Agricultural Society some time ago and a valuable report was drawn up by them, but that is still a great difficulty at the present day and more requires to be done in that direction.

14536. That is under consideration at the present time.—I am glad to hear it. Then, of course, there are numberless other questions with regard to injurious insects and varieties of grasses, and so on.

14537. That is outside the dairy questions to which we have just been alluding?—Yes, I was thinking of agricultural education generally.

14538. (*By Mr. Latham.*) You say you advocate longer courses for dairying?—Yes.

14539. What are you going to teach beyond what you do now if you have longer courses?—A course of a fortnight for butter making is really not sufficient if you are going to get theory and practice in. A student can only learn the rudiments of it in that time, and for the practical work alone it is insufficient.

14540. I quite agree with that, but are you going into an extended method of teaching, would they go to lectures and that kind of thing?—Yes; of course we have lectures in the afternoon now. We are constantly adding to our work. Since the introduction of Dr. Gerber's butyrometer they have to learn the working of that and also the working of a separator; they have to learn to take a separator to pieces and put it together again, and I think three weeks should be the minimum, but I prefer five weeks or even three months if it could be done.

14541. I think you are making a serious mistake in merely asking for an extension of time from two weeks to three weeks. If you are going to ask for an extension of time at all, I think you should go for a considerably longer period?—I am merely putting the minimum at three weeks.

14542. I suppose you will agree that a fortnight is quite long enough to teach the actual butter making, but not if you are going into questions such as the properties of different milk and so on?—Quite so; I think it ought to be longer. Then the next thing I have put down here is "Legislation to follow on lines indicated by scientific investigation." Before I deal with that I would just like to mention one thing as regards the butter making. Ever since we began we have been advised, and it has been our practice, to teach the students to make the butter as dry as possible without injuring the grain or texture, but we have been dreadfully discouraged because legislation does not back us up, and when our students go out into the world and send their butter into the market, they have to compete with water-logged butter, and that is very discouraging. I mention that as one of the discouragements that technical education is met with, that we cannot get the support we desire, and it almost forces the question upon one's mind whether we are really doing the right thing in teaching our students to make their butter dry when they find that the only reward they get for doing it is that they are not able to compete with the water-logged butter that is allowed to be sold.

14543. (*By Professor Middleton.*) You are not satisfied with the 16 per cent. standard?—If it was adhered to and adopted, but it is not yet adopted, and anything more than 16 per cent. we should very much regret. Then as regards the International Dairy Congress in Paris in 1905, I had the privilege of sitting there as one of the British representatives. I need not refer to their conclusions because your Board was represented there, and you have access no doubt to their resolutions, but many of those resolutions I would commend to your attention. I agree with many of them. Then with regard to the unification of analytical methods throughout different countries you will see there were resolutions passed at the Congress, and that is a matter that is coming up again on the next occasion. It is a matter of great importance. Many other questions were raised; they were quite unanimous on the need for further agricultural and dairy instruction. They urged, of course, that winter dairy

schools should be formed, and that there should be an extension of the number of dairy colleges and domestic economy schools. The Congress very strongly expressed an opinion in favour of increased facilities for education. When I was in Paris I was very much impressed with the better system of marketing that they have. I do not think that their produce is better than ours, but it was shown in better form. Take even the turnips: the turnips were washed and bunched and shown in a very much better style than English produce generally is shown; and the same with the poultry. I do not think they were better poultry, but they were better shown and better marketed. I think we have a great deal to learn from their methods of marketing produce. I would also incidentally mention that I ascertained when in Paris that the French Government assisted the agricultural industry to a very much larger extent than we are assisting it in England—I understood to the extent directly and indirectly of three millions sterling per annum, but those figures of course you will be better able to verify than I am.

14544. I think that completes the summary of the evidence which you have put before us?—Yes; I think that is all.

14545. Before your Institute was started in the Eastern Counties what facilities had people for learning dairying?—Nothing whatever. What induced us to start in the Eastern Counties was this. Directly after the British Dairy Farmers' Association had an excursion and conference in the county, the East Suffolk Chamber of Agriculture formed a Committee to take up the matter. It followed on that, and from the establishment of our Institute dates really the improved system in butter making, and since then, of course, a great number of villages have been visited, and a great many remain still to be visited, and in one Division of Lincolnshire nothing whatever has been done at all.

14546. How was that Institute formed? As a limited liability company?—It was formed on that basis. At that time it was considered that on the whole that was the better way in which it could be formed.

14547. That is still the constitution?—Yes, but no dividend has ever been paid, and no interest has been paid on the money.

14548. I see you mention that you have about 80 resident students annually?—Yes.

14549. How many students can you accommodate?—10 at a time. We could accommodate 20 by taking two classes and having the practical work and theoretical work alternately.

14550. Does the farm belong to the Institute?—No, it is hired.

14551. Is it hired by the Institute?—Yes.

14552. So that they are tenants of it?—Yes.

14553. (*By Mr. Latham.*) Yours is purely a dairy Institute?—Yes.

14554. I do not quite agree with you about the scholarships. You simply think that the county scholarships should be thrown open to everyone?—No, I do not say that, but I do not think that poverty should be the test. I do not like the idea of excluding farmers' daughters because those farmers are in better circumstances. It lowers the status of the school and throws obstacles in our way.

14555. Why?—Because you get a less educated person and a person less fitted to take up the work of dairying.

14556. Surely if these people in better circumstances thought it was highly desirable that their daughters should come to you the scholarships would not stand in the way. They would not refrain from sending them because they could not get a scholarship?—By the mere fact of asking that question many a would-be student who had the paper put before him would put it on one side and object to it, and I cannot see why it is ever asked, because technical education is on quite a different footing from elementary education.

14557. If this education is to be provided out of public funds, does it not seem that it ought to be given to those who cannot help themselves?—If a test is to be applied at all, what I would suggest would be an examination test.

14558. That is not the question. There are a great many young people, both male and female, I suppose, that would rather come to you as private individuals than come through a scholarship?—They have the opportunity if they like.

14559. Is it not fair to give people that are not in such good pecuniary circumstances a chance of obtaining this information by means of a scholarship?—If it is a question

of one or the other it might be, but I do not see where it comes in with reference to technical education; there is not a word in the Act with regard to it. I think it arose in this way: that it was thought that free primary education at one time was to be limited to poor children, but nothing of that kind applies in technical instruction, and I think it is a mistake.

14560. Why should the ratepayers pay to educate these people's children who can well afford to pay for it themselves?—The payment hitherto has come from the "whisky money."

14561. It does not matter to me where it comes from?—I cannot see why the question should be asked. I should be glad to know if there is any clause in any Act of Parliament relating to it. I have always failed to find it, and it appears to me it is a mistake.

14562. Do the general people of the county think it is a mistake?—I have often had it mentioned to me that it is wrong, that it is bad policy, and if there is to be any differentiation I should put it on the ground of intelligence; send the most intelligent.

14563. Then in all probability I should think it would be more than probable that the poor people would be absolutely kept out?—I do not want to exclude anyone but I do not like that clause.

14564. There is a greater demand for dairymaids than there is at the present time for dairy instructors?—Undoubtedly.

14565. Then do you not think my argument is exceedingly sound, that you should do everything you possibly can to encourage those who cannot come to you without the assistance of scholarships?—Yes. I do not wish to discourage them, but I also do not wish to discourage the more intelligent ones to come.

14566. It is not a question of intelligence; it is a question of whether the parents are able to pay for the instruction or not?—I think it is a pity to make that a ground of exclusion.

14567. Do you have your students principally from the elementary schools?—We do not take them direct from the elementary schools. Generally a year or two elapses before they come to us, but most of our students have only attended elementary schools.

14568. You say their education is not sufficiently advanced for you to get the best work out of them?—That is so. It is very disappointing when you begin with the theory. I do not say they cannot manage the practical work.

14569. That is to say, when you ask them to write a paper they fail, in all probability?—Yes. I have been asked a question with regard to the examination. A very simple paper is put to them, and they cannot do it. It is very disappointing. Of course it meets us in all walks of life, the deficiency that has in the past arisen with regard to elementary education.

14570. As to the Agricultural Education Committee, you said you would have certain members co-opted?—Yes.

14571. Do you not think that might be carried very much further, and that instead of just co-opting the two men you named that it might be very useful to pick out a few farmers in the district and co-opt them as well?—I was not confining it to those. I was only suggesting those two as two members that ought to be co-opted in each case.

14572. With regard to your remarks about the water-logged butter, do you really mean to say that you find difficulty in selling your own butter?—No, we do not, but we have to compete with butter that is water-logged. We are teaching them to keep their butter as dry as possible, and then our students, when they go out in the world, have to compete with butter that is sold at a penny a pound cheaper, but which contains perhaps 20 per cent. of water.

14573. And even more?—Yes. The public are very indiscriminating; for a penny a pound they do not notice whether the butter is weeping or not, and it is a great discouragement to our students. Technically we are right in making the butter as dry as we can get it, but commercially we are wrong.

14574. Do you not think that the education you give to these young people at this Institute educates people generally about this very important question?—Many of the consumers are not educated; it does educate some, but my experience is that consumers as a class are very indiscriminating in what they buy, and if they see anything that is a penny a pound cheaper, they will buy it, and I think that applies to all products.

Mr. J. A.
Smith.

10 July, 1907.

Mr. J. A.
Smith.
—
10 July, 1907.
—

14575. You mentioned another matter that is very dear to me : packing ?—Yes, that is a very important point.

14576. Do you teach that in your Institute ?—Yes, we are very strict about that in the points we award in judging. Unless the butter is made so that it can be packed properly, they lose a number of points. The Great Eastern Railway has been a pioneer in that respect. They send boxes at a very cheap rate and a very large business is done with the metropolis, and especially in the suburbs of London ; and unless the butter is made exactly symmetrical it will not fit into the boxes, and if it does not fit in exactly, it is a dead loss.

14577. Does that apply to poultry ?—No, but a great deal depends on poultry being properly trussed and packed.

14578. Does your remark about packing apply to packing poultry for market ; do you teach them to pack poultry for market ?—Yes, we teach them to pack

poultry for market, but the great aim in poultry is that they should truss it properly and dress it properly.

14579. In our county we send a great deal of poultry to London and we know there is much education required in packing poultry for the London market as there is in packing butter ?—Yes ; we teach it.

14580. The moment a package of butter is opened or a package of poultry, it is virtually sold if it is packed properly ?—Yes, that is just what struck me when I was in Paris when I saw the way they marketed their produce.

14581. Why cannot we do it as well as they can in Paris ?—We can influence the students, but we cannot influence the whole of the country. We take care to impress it upon our students, that is one of our strong points, the packing of everything.

14582. You do not do anything with regard to fruit ?—No, we have not taken up fruit.

TWENTY-EIGHTH DAY.

Thursday, 11th July, 1907.

PRESENT :

The Lord BARNARD (*in the Chair*).

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. WALTER F. REID, F.C.S., F.I.C., called and examined.

Mr. W. F.
Reid.
—
11 July, 1907.
—

14583. (*By Lord Barnard.*) You are a consulting chemist, are you not ?—Yes.

14584. A Fellow of the Chemical Society and of the Institute of Chemistry ?—Yes.

14585. You take a great interest in horticulture and are a gold medallist of the Royal Horticultural Society?—Yes.

14586. You are also a member of various other societies. You appear here principally as representing the British Bee Keepers' Association ?—As a member of the Council and of a County Association.

14587. Do you speak on behalf of the Council, or whatever the governing body of that Institution is, or solely on your own account ?—On my own account I appear. I have been delegated by the Association in connection with the Chairman of the Association, Mr. Cowan, who is here, and who will speak with greater authority than myself on the administration of the Association. I would like to speak on certain parts of the working of the Association.

14588. You know the terms of reference to this Committee ?—Yes.

14589. So that we will as much as we can keep inside those terms ?—Certainly.

14590. You regard bee keeping as a most important rural industry ?—I think it is of very great importance to both agriculture and horticulture.

14591. Speaking of it for its own sake, is it a source of profit for the working classes ?—It is the most remunerative petty industry in connection with agriculture or horticulture that I know of. I know of nothing that pays better.

14592. Therefore anything that can improve the industry would be of advantage to the working classes in the rural districts ?—There is no doubt about it.

14593. I see by the official return here that considerable sums are spent by a great many counties in promoting the

industry in the way of lectures, and so on. Your own county, Surrey, in particular, spends £200 a year ?—That is so.

14594. That is out of the Local Taxation Residue Grant ?—Yes, I can speak in detail with regard to that. I am a member of the Council.

14595. Most of the counties seem to take the matter up. The British Bee Keepers' Association is a central Association ?—Yes. It is the parent Association of all the county associations.

14596. It has an office in London, I suppose ?—Yes.

14597. You encourage the formation of county associations ?—We do all we can to promote the formation of county associations.

14598. Have you a county association in every county now ?—We have, I think, 30 associations now.

14599. Do they hold meetings in London at the central Association and then disseminate knowledge to the local associations ?—No. The local associations hold their own meetings in their own counties, but we have general meetings of the British Bee Keepers' Association, to which the counties always send delegates. In fact, two members of each county association are entitled to attend the meetings of the British Association.

14600. What constitutes a member of a county association ?—Generally a subscription is required from each member, but in cases of poor cottagers, and so on, the subscription is nominal ; it does not cover the cost incurred by each member.

14601. What is the work which your county association carries on ? Is this £200 paid to you ?—No. It is administered by a joint committee of the Surrey County Council and of the Surrey Bee Keepers' Association. There are six members of the Surrey County Council on the administrative body. The fund which is administered by

that joint committee consists not only of the amount contributed by the County Council, but also of the funds contributed by the members of the Association. In Surrey, I think, it is £150, if I am not mistaken, from the County Council, and £94 from the Association, but you have the official record there, and you say it is £200, I think.

14602. These returns are made up from information given by the county authorities?—That figure is probably correct, then.

14603. This is for the year 1905-6. Perhaps you are talking of a later year?—At any rate the amount that was contributed on the last occasion, the last annual accounts that we have, was £94 from our own funds.

14604. I suppose your own funds are principally derived from benevolent persons who wish to aid the bee keeping industry for the benefit of their poorer neighbours?—To a great extent. There is what I may call a medium class of subscribers who pay just enough to cover the expenses; but on the other hand there are a number who pay very much less than the expenses which they entail on the Association, and then, as you say, we are dependent for the possibility of carrying on the work at all on larger amounts given by people who wish to encourage the industry.

14605. Will you tell us how you spend your money?—The chief method of instruction is in sending out experts throughout the whole United Kingdom, giving lectures at shows in the county, and visiting members at their apiaries. Practically each member of the Association is visited at his apiary by one expert of the Association, and verbal instruction is also imparted to the member in his own apiary. Then, with regard to the chief bee disease, foul brood—

14606. Are the services of these experts available for advice at any time. Suppose a man wants advice in a hurry, and writes?—The Association gives to each member one free expert visit. That is paid for in the member's subscription. If the member wishes to have further advice, say, in harvesting the honey at the end of the season, or anything special, then extra payment is made by the member who has such services placed at his disposal, but the amount is, of course, less. He, being a member, can get those services for very much less than if he were a stranger employing an expert.

14607. Are those services ever called for by persons who are not members?—That the Association does not undertake, only in one respect, and that is with regard to foul brood. In Surrey we help everybody that we know of. We go about and try to find cases of foul brood if we can, because it is infectious and it affects us all, so that we endeavour to find every case and stamp it out if we can.

14608. If your work is helped by County Council funds I should rather have inferred that everybody in the county had some claim on the services of the Association?—There is an agreement with the County Council that the money shall be devoted to certain purposes, and in our accounts those purposes are detailed. I have here a report of the last year and in it particulars are given.

14609. Now will you kindly tell the Committee what constitutes an expert?—Mr. Cowan, our Chairman, will explain to you fully the course taken with regard to the examinations, but I may say, briefly, that there are three certificates granted by the British Bee Keepers' Association, and those who undergo the examinations in connection with those three degrees are entitled to call themselves experts.

14610. You were going to tell us something about bee diseases?—With regard to foul brood, which is the chief disease, we have been very successful in Surrey in diminishing the amount of foul brood. I think we have diminished it from about, speaking from memory, 12 per cent. to something like 2½ per cent.—the number of cases.

14611. You also hold demonstrations at the Royal Show?—Yes. The British Bee Keepers' Association undertakes the management of the honey department at the chief agricultural shows throughout the country, that of the Royal Agricultural Society, the Dairy Show, the Grocers' Exhibition and the Confectioners' Exhibition at Islington. Those are the chief shows throughout the country where honey products are exhibited, and the British Bee Keepers' Association undertakes the management of the department entirely.

14612. Do you give many lectures?—Yes, very many lectures.

14613. When you have local demonstrations and lectures are the people who attend principally bee keepers, or do some attend merely out of curiosity?—I can speak from

personal knowledge there. I very often give lectures myself at shows because we have only a very limited number of experts in the county, and members of the Council assist. I was at Cobham yesterday, for instance, and gave a lecture. There are two classes of people who go there, those who have bees and want to know points about their management, and those who are interested in bees as in any other living object. Those who simply come to listen from general interest very often become bee keepers. When they hear something about the bees and the life of the bees, and so on, they keep them out of interest. Then we have the working man who wishes to know point about harvesting the honey and sometimes about marketing the honey. Those depend to some extent upon the income from their hives.

14614. How should a working man market his honey? Is there any co-operative system in operation?—It has been attempted to have co-operative associations in the counties for that purpose. It was also tried by the British Association. Mr. Cowan will be able to give you further information about that, but I believe the difficulty with the British was this; that a great many members sold the best of their honey for what price they could get, and the the honey which was, perhaps, second class or third class was sent to the co-operative centre; so that there was very great difficulty in getting British honey that was equal to the large bulk that comes in of uniform quality from abroad, although that quality may be inferior to the bulk of the British honey.

14615. That is rather typical of the agricultural class in marketing their produce of all kinds?—I think there is difficulty in that direction. It is rather too small an industry to pay the expense of central management. It is not like the dairy business, for instance.

14616. Is the consumption of honey increasing?—It is.

14617. Is the quality improving?—It is. It is improving very greatly of late years through the extension of the movable frame hive, because in a hive you can have honey from various mixed sources, some of it not very nice and some of it very nice. Last week the lime trees began to bloom, and where you are dependent on the lime trees for the bulk of your honey, with a movable frame hive you can take out all the previous imperfect honey and collect the very best while the honey flow is on from a certain source. The same with clover and any other sorts of honey. Therefore the quality of honey that is produced of late years is very much better on the average than the old quality.

14618. I live in the North of England where there is much heather. You have mentioned several kinds of honey. Have you ever made a study of heather honey?—Yes. We have that in Surrey, too. The heather honey is one of the best qualities of honey that we know, but it does not always please the southern palate, perhaps because they have not had it as children. It is a little strong in flavour and a very nice honey indeed; perhaps it is too strong for some palates, but it is an excellent honey.

14619. I gather there must be some very good reason why all the bee keepers in the low-lying villages in the county of Durham send their bees up on to the moors in the autumn?—There is a very good reason; because the heather comes into yielding at a time when the other sources of honey are over, so that they double their honey harvest. The same as on the Nile, they send the bees in boats up the Nile to extract the honey from the different flowers as they come into bloom.

14620. Are you satisfied with the present organisation all over the country. Is it sufficient? Is there sufficient information on bee keeping being given? Does the supply of information meet the demand?—No. I think it is quite impossible that it should, because the British Association has practically no funds. The British Association can only just cover its own expenses as it is now. It does what it can with the money at its disposal, but it only disposes of some £200 or £300 a year. If it had a fund of, say, £500 a year that it could reckon upon it could impart instruction in those counties, especially, where there is no county association.

14621. You try to encourage counties who have no association to organise one, I suppose?—Yes, always. It was only two or three months ago that we organised one in Kent. I was in the chair when it was organised.

14622. Do you urge them to obtain a grant from the County Council?—I do not think they require urging. They naturally obtain funds from whatever source they can, but I would like to say this with regard to the County Councils, that whereas the expenditure in Surrey has been most useful and beneficial towards bee-keepers and towards

Mr. W. F.
Reid.

Mr. W. F.
Reid.

11 July, 1907.

agriculturists and horticulturists generally in consequence, yet there are county associations where bee-keeping instruction imparted is of a very, I will not say pernicious character, but of a very useless character, for the reason that the experts who are sometimes appointed by the county councils are not experts from our point of view at all; sometimes they are old, what you call practical, bee-keepers who are far behind the times as regards modern bee-keeping; and again, and I am afraid the number of cases is growing, a young fellow straight from college is appointed as lecturer who knows nothing of practical bee-keeping at all; he can teach the theory of it, but county councils have full control over their own funds, and the county associations are not in some cases consulted in any way at all, although the British Association or the county association are always willing to assist in any way.

14623. Would it be desirable that your central Association should try and influence county councils on the subject by circularising them and their education committees, and so on?—It is a delicate question. We are always willing to do what we can, but we have, as I say, very little money available for circularising or anything else, but whenever we are consulted by a county council we are willing to help, and the possession of our first-class certificate is a guarantee that the possessor of it is competent to lecture as well as to give practical instruction.

14624. Are there any text books?—Yes, there are text books, some excellent text books.

14625. Is your certificate awarded on a written or practical examination, or both?—Mr. Cowan will give you the full particulars of that. There are three examinations passed.

14626. Do you suggest that you should have public money to assist the operations of your associations?—I think the same course might with advantage be adopted in the case of the central parent body of all the associations as is adopted in the counties in the case of the County Councils. There might be a joint committee to administer such funds, but I do not know of any way in which bee-keeping could be better taught than by the most experienced body in existence in this country for teaching it.

14627. Are you often in touch with the Board of Agriculture?—We are often in touch, but I wish we were more in touch with them, because if we were they would not send out our illustrations upside down. It is rather awkward to have to tell these people you are lecturing to on foul brood, for instance, that the illustrations are upside down, and that they must turn the paper the other way about so that they can follow you.

14628. Is there any other point you wish to mention?—No, I do not think there is any other point.

14629. Of course we must bear in mind what you have already referred to, that incidentally bees are extremely useful from an agricultural and horticultural point of view?—We have definite cases. Mr. Cowan has published some, and he will give you full information upon that, but we know especially one case, Mr. Richard Brown of Somersham, who did not get the yield he expected from his fruit, and he started keeping bees, and now it has improved simply marvellously. He was fully of opinion that that increase was due to his keeping bees, and he has increased his stock of bees to a very large extent since then, and he produces a large quantity of honey now, and in America it is quite a common thing to have hives of bees in the orchards, because some kinds of fruit are not self fertile and some agent must bring the pollen from other kinds of fruit, such as different varieties of apples, in order to fertilise them, and bees have been found extremely valuable in that respect.

14630. You mention America. You were in America as Vice-Chairman of the Horticultural Section of the St. Louis Exhibition?—I was.

14631. While in America you interested yourself in the work of the agricultural colleges?—Yes, I had to judge the products that were exhibited at St. Louis, and practically all the States had Agricultural Colleges which exhibited their work.

14632. What was the result of that?—Some of the exhibits were most excellent and showed very great improvement in the products of which they consisted.

14633. What do they do now that we do not do and that we might with advantage copy?—One thing, for instance, is research work. I can give you an instance. There was one very good exhibit that I saw where they had been carrying on, I think, for a series of seven years, research with the object of reducing or increasing the percentage of oil in corn—that is our maize, of course. They had started

with a grain containing about 4 per cent. of oil and they had selected the seed year after year according to the percentage of oil, and they had reduced it with one seed to 3 per cent., and on the other hand they had increased it to what would have been looked upon as an enormous figure formerly, 6 per cent.; so they have by that means produced a variety which would have very great value, and the production of such corn on a very large scale there would have meant an increase in the income of the farmers of a great number of million dollars, I do not remember the figure, but many million dollars annually from that one research.

14634. You think that a similar system of research ought to be adopted in the case of crops grown in England?—I think so. In the United States the different States are very wide apart, and the area so enormous that it is absolutely necessary that each State should have its own department. One grows cotton, another will grow wheat, and each one must deal with the industry which is chiefly represented within its own borders, but in Great Britain the difference in climate does not exist to that extent, and I think to have an association of that kind for each county would be wasteful and would result in duplication.

14635. Work like that should be done by somebody?—That kind of work should be done by somebody I think, because without having a research fund of that kind you cannot ensure the continuity which is necessary to develop new things or to try new things.

14636. Perhaps you are not aware that the Board of Agriculture have the subject under their consideration at the present time?—I am not aware in what way it is being dealt with, but my point is that it should be dealt with as a national question in some way. There are many points that I could indicate in this country where researches could be undertaken that require a series of years.

14637. Yes; but we have had evidence from a gentleman only yesterday, who emphasised the necessity for research in connection with barley. You have also gone as a member of the Agricultural Education Jury to Milan?—Yes.

14638. When you were in Italy you made some observations?—Yes. I was on the Agricultural Education Jury among other things, and I came across a system of agriculture there which I thought was of very great importance, and I sent a memoir upon it to Mr. Haldane. He has been good enough to lend me that memoir for the purposes of this inquiry. The system is a system of agricultural education that is imparted to all Italian soldiers. Nearly the whole of the Italian Army is instructed in agricultural operations. There are a great number of districts, 220, in which education is given, and there are demonstration camps. It may be an educational field or a demonstration camp, but at any rate in a large number of centres they teach the soldiers practically, and I believe that that form of work is welcome to the soldiers. They like it. I made inquiries of several private soldiers, and they seemed to take great pride in the work and enjoy it. The reason I refer to it here is that in that way the whole of the able-bodied population practically, especially the poorer classes in Italy, learn agriculture, and when they leave the colours they can always find occupation in agricultural work.

14639. I suppose, as a matter of fact, a very large proportion of the poorer classes in Italy are agriculturists, are they not?—They are; but having conscription in the country, the young people are taken away just at the very time when they are most susceptible to learn agriculture—the same as we do; we take the young fellows away and teach them something that is no good to them when they leave the colours.

14640. In England we do not take them away against their will. They come voluntarily?—That is not my point. My point is that when they leave us after they have done the work we have taught them, and that we have paid them to do, it is of no use to them and that is where they fail. I have the particulars of this if the Committee would like to see the *precis* of it. (*Handing document.*)

14641. As the Government take these young men away from their natural pursuit, which would be agriculture in a very large number of instances, it is only fair that in return for that they should help them in some way to follow out their profession or business in after life?—I do not think that is the only reason. I think one of the reasons was to find them an occupation.

14642. Would you suggest that such a thing would be practicable in this country?—Certainly, and I think the soldiers would be very pleased.

14643. Are you familiar with the British soldier's life?—Not all of it, but with a great deal of it I am.

14644. I am not a soldier, but I am familiar to a certain extent with the soldier's life, and I have been told by a relation of my own, himself 23 years in the Army, that it is impossible for the British soldier to find time when he has done his day's soldiering, as a rule, to take up any other employment?—My view is this: that the British soldier does a great deal that he need not do, and if he were allowed to do a lot of things that were useful he would do them. For instance, formerly manœuvring in large bodies was considered correct, but I happened to invent smokeless powder and that has done away with that. That necessarily must make a great gap in soldiers' occupations.

14645. We must not go too deeply into it, because that is a matter for the War Office, but my idea was that the British soldier and the Italian soldier could not at all be compared, and even though in one direction he may have been spared a certain amount of work, do you not think it possible that the authorities fill up his time pretty well except, of course, such leisure time as every man must have?—I am not competent to express an opinion on the efficiency of the Italian soldier, being educated as he is, with this addition to his curriculum as compared with our soldiers. Of course, man for man, naturally one considers that the British soldier is superior, but I am speaking with regard to his teaching, and much of the knowledge that is imparted to him is for use in time of war. Some of the items of instruction given to the soldier in Milan are necessary, for instance, cattle and horses, and spade work and a number of things are imported into the teaching which are useful to the soldier as a soldier; the two overlap to some extent.

14646. At any rate, you suggest that an opportunity ought to be given to the British soldier to learn agricultural work if he liked?—I believe you are going to have detailed information on this very subject. I think it began by the soldiers in each district in Italy volunteering and in farmers allowing them to work on their farms, those that volunteered, and in that way it spread so rapidly that the Government, after hesitation for about 10 years, I think, ultimately made it general, as it is now.

14647. Of course there is another feature that has to be considered: that our troops spend a great deal of their time abroad, far more than those of any other foreign country. A young man joins the British Army, say, at 18, sometimes younger, and by the time he is 20 he is off. You could not teach him much British agriculture out in India, for instance?—That is so, but, unfortunately, so many of them come back here again to try to find employment and they cannot do it, and if they did know something about agriculture they might possibly find it in the country. That was the only reason that made me send that report to the War Office and they seemed very glad to have it.

14648. You use the words in the last paragraph of your memorandum, "if they emigrate." I believe it is a fact, in consequence of the poverty of the country, that the lower orders in Italy emigrate a good deal to South America, do not they—to the Argentine, for instance?—Yes, a great many do emigrate. I have been in the Argentine myself, and the agricultural labourers there are chiefly Italians, because the natives themselves do not care about working in agriculture; they look after cattle principally.

14649. The Argentine is purely an agricultural country?—Chiefly.

14650. So that if a young man is drafted into the Italian army and later in life chooses to go to the Argentine you think he has derived an advantage during his military training which will stand him in good stead in his new home if he emigrates?—Undoubtedly, because without a knowledge of agriculture he has to learn it first. That is our difficulty in Canada. The young people go out there and know nothing whatever about agriculture and they will not have them.

14651. Because they have no knowledge of agriculture?—That is so. They cannot even dig, and what is the use of a man on the land who has no knowledge whatever of dealing with the land? He knows nothing; he cannot even do a day's digging.

14652. You think if the British soldier were instructed in the elements of agricultural work that he would be qualified to go to Canada and get work there after he had left the army?—Yes; he could not only get work as an agricultural labourer, but he could get land and till it himself.

14653. (By Professor Middleton.) With reference to the instruction of the Italian soldier that you have been speaking about, was it not the case that that began by giving theoretical instruction, and by the holding of

classes in agriculture for soldiers?—Yes, that was so, and the distribution of literature.

14654. And that that has spread because of the interest which the men themselves took in the instruction which was given?—Yes. I think that is what Commendatore Vigone said, and he is one of the greatest authorities.

14655. (By Lord Barnard.) He probably is an enthusiast, is he not?—He is probably, but he is a practical man, too.

14656. (By Professor Middleton.) You say you have diminished foul brood in Surrey from 12 per cent. to 2½ per cent. ?—To about 2½ per cent. I think those are the figures. I think that is nearly correct.

14657. Do you agree that the treatment of this disease is a matter really of care and the use of disinfectants and the taking of precautions?—I think the treatment ought to be as clearly antiseptic as, for instance, the treatment of our own sick in a smallpox or infectious hospital. It is an infectious disease.

14658. What I mean is, that it is a disease that is quite within the power of bee keepers to control?—Undoubtedly.

14659. Your experience has shown that?—Certainly.

14660. When you find any large amount of that disease you find the bee keepers in that district are badly instructed?—Yes, or badly organised.

14661. So that the presence of this disease indicates a lack of education on the part of the bee keeper?—Yes, to some extent.

14662. As a chief means of getting rid of this disease you argue for further education of the bee keeper?—I think it is the only way. If a man has a disease to deal with and does not know how to handle it he cannot cure it.

14663. Are there any other diseases of bees that trouble you at present?—Yes. In the Isle of Wight there is a serious one, and I believe this Board has sent an inspector down there to enquire into it.

14664. You have no knowledge of that disease?—No, I am glad to say.

14665. Who are the experts who are working with regard to bee diseases?—It is not a subject that is large enough for anyone to make a special study of, but I do not think we have any higher expert than Mr. Cowan himself. He has published a great deal of information on the subject, and he will be able to tell you all about the diseases of bees, and something about the disease in the Isle of Wight too, I think.

14666. (By Mr. Latham.) You spoke of the profit to the agricultural labourer by keeping bees?—Yes.

14667. What profit does it produce?—It depends, of course, like all other agricultural pursuits, upon the season to some extent. I live at Addlestone, near Weybridge, and I can reckon on getting 30 to 40 lbs. of honey from each hive, and if you sell your honey at about sixpence a pound that will give you practically the income in an average year. Sometimes, of course, you get more. We have accounts of as much as 100 lbs. in some districts, according to the flow of honey that is about.

14668. There is a strong feeling in some agricultural districts as to having a large quantity of bees about, is there not?—I have not met any general objection; I have personally never come across one. I might say the only thing of that kind that came under my notice was that a neighbour of mine came to me and said that my bees were eating his plums. I pointed out to him that bees with their weak jaws could not possibly have been eating the plums, but that they might have sucked them after they had been broken by wasps. I sent him in some of my honey, which I took from the hive, and soon after that he said to me that after all it could not have been my bees that had been eating his plums, because the honey did not taste of plums.

14669. Is there not great difficulty in getting competent teachers of bee keeping in the rural districts?—With regard to the teaching of bee keeping in rural districts, teachers need not be absolutely resident on the spot, they can teach in two ways, either practically in the apiaries in the summer when the bees are flying, or they can teach in evening classes during the winter.

14670. There is rather a feeling against evening classes, is there not?—I do not know that they do so much good as the actual practical work in the apiary; I myself am very much in favour of the practical work.

14671. How do you suggest that that can be increased, the sending of what you consider competent teachers

Mr. W. F. Reid

11 July, 1907.

round to teach the agricultural labourers in the proper season?—The British Bee Keepers' Association, if they had funds at their disposal, could send to those counties which are not at present represented by county bee keeping associations, and probably many of those are rural districts where the knowledge would be most useful to the inhabitants.

14672. What would be the probable cost?—In Surrey we can spend to advantage over £300 a year.

14673. I am on a county council myself, and I should like to know what would be the probable cost per county to send round to the several villages teachers of bee keeping to the cottagers?—I think you might put it at about a guinea a lecture.

14674. That would include the travelling expenses, would it?—It depends on the distance you have to go, and how you can get at the place, it would be a little more, naturally, if it was a long distance.

14675. Provided some of these county councils that are not very close to you wish to have bee-keeping instruction, what would be the probable fees that you would charge per season to the county councils?—You have an actual account of the Surrey Association there. I handed the book in.

14676. What would be about the amount that you would expect to be set aside for the purpose, provided the county makes application to you to have an itinerant teacher. Supposing he went to twenty villages during the season, we will say?—The number of lectures given in Surrey is recorded in that book. The Surrey County Council apportion £150 for that teaching.

14677. (*By Lord Barnard.*) I have had the opportunity of reading the account and it seems that the County Council of Surrey have entered into a written agreement with your Association under which they make you three grants, one of £70, one of £60, and one of £20, making a total of £150, and each of those grants is for a specific object. One is for providing an outdoor demonstration and one evening lecture, that is the £70; the £60 is publishing a monthly journal free to members, and engaging experts to visit and for secretarial and clerical work, and £20 for giving lectures in certain places, and then the balance of the amount spent by the Association on those three objects has to be provided out of the funds of the Association?—Yes, which comes out of our own pockets.

14678. (*By Mr. Latham.*) Now I want you to let us know what lectures would be necessary, first of all for starting these men in bee-keeping in the early spring, and then the taking of the honey and the placing of the bees away for the winter. Those are the three things that we fancy are badly managed?—In order to give effective instruction and to utilise the funds in the best way we find it is absolutely necessary to go to the people, and we go to flower shows throughout the country and find the people there who are interested in bees, because we have found by long practice for many years that it is impossible to bring an audience together in a rural district simply to listen to a bee lecture only; you cannot get them to leave their ordinary pursuits for that purpose. You may sometimes send a lecturer round at considerable intervals to deliver a lecture in some village hall or somewhere upon bees, but, as a rule, we do not get such satisfactory audiences in that way as we do if we go to a flower show or some place where agriculturists or horticulturists are collected.

14679. One question that gives a great deal of trouble is the hiving of the swarms of bees. Do you send people round to instruct in that?—We instruct how to do it, but as the hiving of the swarms extends over three months at least and may happen any day, it would, obviously, be impossible for us always to have a man at hand or anywhere near to do it, but we can, through a register of our experts in any neighbourhood or a register of our members, always supply anybody in any neighbourhood with a list of persons who may be called upon to help them.

14680. Do you make it known that these men will give instruction and advice if necessary?—Yes, the British Bee-keepers' Association issue a handbook for bee-keepers. Mr. Cowan has published the Bee-keepers' Guide Book, which is the best book on the subject, but the British Bee-keepers' Association also issue a book.

14681 I suppose we may take it for granted if any quantity of these men were to take up bee-keeping you would take enough interest in it to send someone down periodically?—Yes, we could send a first-class expert lecturer throughout the country if we had the funds; he is a gentleman who manages our apiary at Swanley.

14682. I have been steward of the Bee exhibitions at several county shows, and often men go there and talk the biggest rubbish I have ever heard in my life. Do you send men out to shows to manage the bees, and give lectures during agricultural shows?—Where there is a county association we always leave work of that kind to the county association. The possession of a certificate of the British would be a guarantee that the lecturer had sufficient knowledge of his subject not to talk nonsense anyhow.

14683. Would it not be necessary for this lecturer to hold some diploma?—He does; we give a diploma.

14684. I presume at most of these shows it would be just as well to make an application to you and let you appoint your own man?—I think it is better, if there is a county association, to do it through the county association, which must naturally have a better personal knowledge of the lecturers.

14685. But if he held the diploma from you you would know the man perfectly well, and would not that be a sufficient guarantee?—Yes, but there are many other things that are desirable in a lecturer; for instance, if he has a personal knowledge of the people in the neighbourhood, and knows who is keeping the bees, and how they keep them, he is a very much better man to deal with them and to advise than a stranger from another district; and then the cost of the journey is also considerable to a stranger. Supposing we were asked to give a lecture in Lancashire, of course we could do it, but sending a man from London would be a considerable cost.

14686. I do not think you quite understand my question. If these men in the several rural districts hold diplomas from you, you would know the men that were in the districts, and any recommendation from you in reply to an application for a man would be a guarantee of his capability?—Certainly.

14687. Would you not recommend that?—Certainly; in fact I go so far as to say a County Council ought not to spend public money unless the person giving the instruction holds a certificate of capacity for doing the work. Such a certificate is issued, and such a certificate ought to be asked for.

14688. I want to go rather further than that. I want to know whether you would not recommend the agricultural show committees to make the application to you direct to appoint a person to manage the bees in the show-yard, rather than go to a person that you have no knowledge of, whether they hold a diploma or not?—Certainly I would recommend that. That is what is done by the Royal and other chief exhibitions in the country that I have mentioned.

14689. I see you say that if you have an increased grant of £400 or £500 a year you might do a great deal more throughout the country. Is not that a very small sum to ask the country at large?—It is small, and we could do a great deal more if we had more, but even with that sum we could do a great amount of work of a general nature throughout the country.

14690. That means you should have local contributions to some considerable extent as well?—Certainly. The ground where there is an association is fairly well covered, but we must not forget the areas where there is no county association, and in those areas we might do a great deal of work.

14691. I should like to get exactly on the Minutes what you mean by the increased production in orchards where bees are kept. You say somewhere that by keeping bees in orchards the fruit culture can be considerably increased?—Yes, the yield of fruit from the trees is very largely increased, because in some seasons fertilisation of the blossoms in order to produce fruit is absolutely dependent on bees, and unless there are bees somewhere about, you may have in some districts sterile pear and plum trees, whereas if you happen to put a few hives near those trees then you get fruit. I am in a district where they say they cannot grow plums, and my neighbours have also said that they could not grow pears, but now since I started my bees we get both plums and pears. Where people cannot grow these things they often think it is the soil, but very often it arises through want of fertilisation.

14692. You would advocate that if people want to get a good production of fruit they ought to keep bees in their orchards?—I think it is very necessary. And the hives should be close to the fruit trees, because in our uncertain climate bees cannot always fly very far, and in our uncertain spring weather if the sun only shines for half an hour the bees will fly sufficiently to fertilise all the blossoms in their own neighbourhood if the hives are placed near to the trees.

Mr. W. F.
Reid.

11 July, 1907.

14693. I think there is a great deal of misapprehension with regard to the keeping of bees in the orchards themselves. I always maintain that it is absolutely necessary that they should be actually kept in the orchard. What is your opinion about that?—I quite agree with you. It is better for the fruit grower, and it is better for the bee-keeper to have the hives in the orchards although some bees lose themselves, especially in rainy weather, and many others when they are flying home loaded with honey knock themselves against the branches of the trees and fall to the ground and get numbed.

14694. That is a thing that will always happen where there are trees?—Yes, but we must not forget that bees very often live in woods, so that it cannot be fatal to them.

14695. You say soldiers do not make good labourers after they leave the army?—No, I do not say that, because I have employed many discharged soldiers and I prefer them to other labourers. What I say is that the British soldier when he is discharged from the army has no knowledge of any industry at all, and if they had a knowledge of agriculture it would absorb very large numbers of men when they left the army.

14696. Are not the great drafts of the British soldiers generally drawn from the rural districts?—I think many are.

14697. (By Lord Barnard.) I think that is hardly so. My belief is that the large towns are the greatest recruiting grounds, London especially; and then I think Glasgow and Liverpool come next as recruiting stations, and a great many come from Tyneside.

14698. (By Mr. Latham.) However, I have often employed reserve men, and I have found that they have been almost universally skilled as agriculturists. You rather think they should be taught something in the army to make them useful when they leave the army, but I always find that those men make very good labourers?—I also find them very good labourers. I have employed large numbers of them. I have put up several dynamite factories and have employed considerable numbers of men, and I prefer to have discharged soldiers under those conditions than any other labourers because they have a habit of doing what you tell them.

14699. They are disciplined?—Exactly.

14700. (By Mr. Medd.) Can you give any detailed account of the methods of agricultural instruction that are imparted to the soldiers in the Italian army?—It appears in the pamphlet that I have handed in. There is a course of 22 lectures given in the Milan District, and they are typical of the course given in the others. You will see the heading of each lecture set out in full in that document.

14701. We have had the estimate of the cost of an itinerant lecturer in Surrey. You put that down at a maximum of £150 at present?—£150 is not the cost of the lecturer only; £60 of that is for a journal that is published monthly to all the members.

14702. When I speak of the lecturer, I mean all that is included in the bee-keepers' work?—The educational work?

14703. Yes.—Yes, that is so.

14704. Is it not a fact that very considerable areas are quite unfit for the keeping of bees?—I could not mention any large area in Great Britain that is quite unfit for them.

14705. I happen to live in Gloucestershire. Would you consider the top of the Cotswolds a suitable place for bees?—You would not get a large surplus, but you ought to get a surplus there.

14706. A friend of mine, a well-known man there, told me that a bee-keeper had come specially to him and begged a little bit of land of him on which to set up some hives, and he laughed and said that he could not have chosen a worse place in England. The question is in regard to the probable expense involved in each county. There must be areas where bee-keeping is not likely to be profitable?—The most unprofitable area that I know of is where we are sitting now. Bees in this neighbourhood would get a lot of surplus, but they would get it out of confectioners' shops, and it will not be honey; it will be sugar. In Paris they have prohibited them from keeping bees within the area of the town.

14707. As I understand, your desire is that an instructor in bee-keeping should be officially attached to every County Council, just as they have instructors in farriery and other things?—I think I could say with the greatest confidence

that there is not a county in England where it would not be advantageous to have some instruction in bee-keeping.

14708. The rate of payment to peripatetic teachers in various subjects is very much below £150 per annum?—Yes. The £150 would not go to the one man for the one thing if the education were properly apportioned.

14709. No; but I was thinking rather of having one special teacher of bee-keeping, and what I then said is that I do not think counties can afford to pay a salary of £150 per annum?—It is not £150 to one lecturer by any means.

14710. All I wish to have you acknowledge is that the payments must be variable in different counties?—Undoubtedly.

14711. (By Mr. Latham.) In the Cotswolds there may be a difficulty in keeping bees, but I believe the clover fields in agricultural districts are large accessories to honey production?—Very important indeed.

14712. And if farmers would only keep their bees out in their clover fields, in all probability they would make as much honey from the clover fields as they would make in the orchards?—A great deal more. May I add to that by saying the very question of any particular area being suitable or not for bee keeping is one that could be solved in a very short time by any expert of experience. If you were to place me down, for instance, in any spot in Great Britain, I would be able to tell you in a very short time whether it would be likely to be a good place for keeping bees or not.

14713. (By Mr. Medd.) It all depends on the climate and the nature of the trees and crops in the various districts?—Exactly.

14714. In your propaganda are you advocating bee-keeping as a self-supporting industry or merely a subsidiary industry to other occupations?—I do not think in this country you can consider it a self-supporting industry. It is always a source of profit, but it is not sufficient for a man to live on in most cases.

14715. If it is conducted by anyone with knowledge it can be made a certain source of profit?—Yes, but not a sole means of livelihood. We have a few large bee-keepers that live by producing honey, but they are few in this country; in America it is quite a different thing.

14716. (By Lord Barnard.) I see in the Report of the Board of Agriculture with regard to bee-keeping in a certain county, it says, "instruction is given in bee-keeping by means of lectures in rural districts, and also by visits of advice to bee-keepers"; and in another centre it says "instruction is given by lecturers engaged as required." There is no mention of any bee-keepers' association expert. I suppose you would rather deprecate the work being done on those lines? It says nothing about the lecturer being a qualified man?—It is assumed that he is a qualified man, otherwise they would not engage him.

14717. I rather understood from you that they had engaged sometimes unqualified men?—That is so.

14718. Therefore we may assume, as nothing is said about their qualifications, that they are probably not qualified men?—We know from our experience on the Council of the British Association that that does happen. Mr. Cowan will be able to corroborate that. I think in very many cases so-called experts are not experts at all, and their tuition would be very much better left out altogether.

14719. Here is another case where the County Council makes a grant to the local Bee-keepers' Association. Lectures are given, and the Association arranges for experts to visit hives and give advice. It is probable in that case they would be experts?—We cannot tell, of course. If they were to say experts who had the first-class certificate of the British, we should know. Our expert in Surrey holds that certificate.

14720. You, as the central Association, ought to impress on the county associations that they ought not to employ a man who is not a properly qualified man. Do you do that?—We do that as far as we possibly can.

14721. The probability is that they were qualified men in that case?—It is most probable.

14722. The work can be done better, you think, through a local body than through a central society?—Yes, because they have the whole of the organisation of their particular districts.

Mr. T. W. COWAN, F.L.S., called and examined.

Mr. T. W.
Cowan.

11 July 1907.

14723. (By Lord Barnard.) You are Chairman of the British Bee-keepers' Association?—Yes.

14724. You are a Fellow of several societies, I think?—Yes, and I am also an honorary member of a number of foreign bee-keepers' associations throughout the world.

14725. As we have heard from the last witness, you have published various works on bee keeping?—I have.

14726. You would like to give the Committee, I understand, some information as to the work now being carried on by the British Bee-keepers' Association. You had an opportunity of hearing the evidence of the last witness, Mr. Reid?—I did, and I need not go over the same ground. The British Bee-keepers' Association was established in 1874 for the purpose of furthering the best interests of bee keeping as an important branch of agriculture. Prior to this nothing was done to foster bee keeping in this country, and the educational work has been carried on without any Government aid. When I say without any aid, I must except the leaflets that have been published by the Board of Agriculture, and recently the Board of Agriculture sent down an expert to the Isle of Wight to investigate the outbreak of disease there.

14727. Did they come to you for that expert?—No, he came from Cambridge, I believe.

14728. I do not mean exactly the locality; but did they apply to you for an expert?—No, they did not come to us. It would have been advantageous if he had had a bee expert with him.

14729. (By Professor Middleton.) He had the benefit of the help of the local expert?—No doubt, but you would not know whether the local expert was a properly qualified expert or not.

14730. (By Lord Barnard.) When the Board of Agriculture find it necessary to take any action in the interest of bee-keepers they should get the benefit of your advice and the advice and assistance of your Association?—Certainly. I think it would be advantageous, and we should always be pleased to give any advice we could or to recommend any experts.

14731. Do you consider that your Association embodies most of the best scientific knowledge on the subject?—Yes—practical knowledge, I should say, but we have no bacteriologists or men of that class to take up the subject of diseases. In the year 1880 the Council of the British Bee-keepers' Association commenced examinations; they appointed a Board of Examiners, and decided to grant certificates of different classes—first, second, and third class. The third-class examinations, usually held in connection with some show, were for practical work, and the candidates had to submit to an oral examination, a sort of preliminary examination, and if they were able to pass the third-class examination they were entitled to go in for the second-class examination. The second-class examinations are carried on by paper work entirely, on the same plan as the Oxford and Cambridge local examinations. We appointed certain superintendents and centres, and the question papers were sent down in sealed packets. Those were opened in the presence of the candidates, and handed to the different candidates on exactly the same plan as the Oxford and Cambridge examinations. If a candidate was able to pass the second-class examination he was entitled to go in for the first-class examination. The first-class examinations were held in London, and they were very strict examinations. There is a certain amount of paper work which is of the highest grade. They have to show a thorough knowledge of bee keeping, both theoretically and practically, and, besides that, they have to give an extempore lecture before the Board of Examiners or Council on any subject that the Board choose to set them at the time. They give them five minutes to collect their thoughts, and then they have to deliver their lecture, and if they can pass the lecture they are awarded the first-class certificate, which entitles them to work as lecturers. Those are the first-class men. Beside that they have to give evidence of a good general education, so that those who pass as first-class experts are supposed to be well-educated men.

14732. Could you tell us anything like the numbers that come up for those examinations?—I was just going to mention that. There have been 1,183 certificates issued in all, of which 951 were of the elementary grade, 182 second, and 50 for lectureships. These figures include male and female candidates, and the relative proportions are: first-class males 45, females 5; total 50.

14733. I hardly think it necessary for you to give us the proportions of the males and females, unless you think it important?—It is because some of these female lecturers are getting appointments, and some of them have obtained positions as experts in the Colonies. In the second class there were 142 males and 40 females; in the third class, 748 males and 203 females. The third class experts' certificates are simply to show that they are able to manage bees. There is no special education required in that class; but the first-class experts are capable of doing anything in the way of teaching or lecturing.

14734. Is there any fee for those examinations?—Yes. May I hand you the papers? (*Handing documents.*)

14735. What is the object of people going in for these third-class certificates?—The advantage is this, that we know that the men who come up for the first-class certificates are practical men, and are not only able to lecture but are thorough practical people. They have to pass their practical examination, that is the third-class examination, before they can go in for the second or first.

14736. I am surprised to find that as many as 950 third-class certificates are awarded. I cannot quite see what advantage those certificate holders get except as a public testimony to their knowledge. Is it a pecuniary advantage to them in any way?—No; except in villages they can sometimes attend people and give advice, but they are not qualified to lecture or to teach; some of the second-class experts are able to teach, but they are not qualified to lecture. Many of the third class hope to get a higher-class certificate, but fail to do so.

14737. Have you any publication in connection with your Association?—Yes, we have a manual that we issue, and leaflets. Here are a few of the papers that we distribute wholesale. (*Handing documents.*)

14738. Do you send copies of your publications to the Board of Agriculture?—I believe so; I believe they have got all our publications, or had them.

14739. Do you not think it would be a good thing if everything you published were placed in the hands of the Board of Agriculture?—I do not know that they do not get them; I believe our secretary sends them to the Board of Agriculture.

14740. Our assistant secretary is pretty well acquainted with all the publications and printed papers which the Board get and he says he has never seen these before?—It is our secretary's place to send them to the Board of Agriculture, and I will see they are sent in future.

14741. This is following up a previous question of mine on another point suggesting closer connection with the Board?—The Board of Agriculture has published three leaflets and we gave them assistance with these; in fact, the first leaflet on foul brood was written by myself for the Board of Agriculture.

14742. It occurs to me that the connection of your Association with the Board might be drawn closer with advantage?—Certainly; we should be very glad to be in closer connection with them. I gave evidence before the Departmental Committee on Fruit Growing, and in that evidence I went very extensively into the question of fertilisation of fruit trees by bees and the necessity of bees for that purpose. We advocate bee-keeping not only for the sake of the honey that can be produced, but likewise for the advantage the agriculturist derives by the fertilisation of flowers and fruit trees.

14743. Therefore we can refer to your evidence in the report of that Committee; at any rate I suggest to you that you should refer this Committee to the evidence you gave on the subject of fertilisation to that Committee?—Yes, that would save going over the same ground again.

14744. I see from your *précis* here that you have an experimental apiary?—Yes, we have an experimental apiary at Swanley in charge of our expert. It is open to public inspection, and at this apiary bees are kept and sent to different parts of the country for lectures and demonstrations. Besides his work at the apiary, the expert gives lectures and instruction at Swanley College, and likewise at Lady Warwick's College at Studley, and he assists by giving instruction and lectures for different County Councils.

14745. What does this experimental station consist of, how much land is there?—It is in connection with the Swanley College. They give us the land on which to put

the hives; we have a building there and a certain number of hives, and the expert goes down and works there.

14746. He does not live on the spot?—No; but he is there a great deal, because he has to give lectures at Swanley College, so that he is practically the greatest part of his time on the spot.

14747. Does he do any research work?—Not scientific research work, it is all practical work; but he is a man that we should have every confidence in sending with a scientific man.

14748. As a kind of assistant?—Yes.

14749. Your Association also appoint judges and lecturers at agricultural and other shows?—Yes.

14750. Do you volunteer to do that or do you wait until they apply to you?—The counties in which there are associations generally apply to us for judges and we send down a judge; and likewise the agricultural societies. We have been in touch with the Royal Agricultural Society now since 1879; we have conducted their honey department at the show, and have sent our expert lecturer down there.

14751. I have often been to the Royal Show and seen their exhibit. Do you think that exhibit is conducted with benefit?—Certainly; a great many have started bee keeping from attending lectures there and likewise seeing the exhibition of honey in the department.

14752. Now as to the finance of your society?—Our society derives its income entirely from subscriptions and donations; it amounts to between £300 and £400 a year, which is entirely insufficient for the demands upon us.

14753. How is the society governed—by an executive committee?—We have a Council of 21 members.

14754. How often do they meet?—We meet once a month.

14755. Where?—In London—in Jermyn Street. We have an office at 12, Hanover Square, and we have a meeting room there. The Society for the Prevention of Cruelty to Animals has granted us the use of their Board room for a number of years, and so we meet there regularly once a month. The county associations, which are affiliated to us, and which we promoted in the first instance, send two delegates, or have the right of sending two delegates, to our meetings, who are *ex officio* members of our Council.

14756. How many paid officers have you?—We have two, the secretary and our expert.

14757. Have you ever passed resolutions—have you any entries in your minute-books on the subject of the insufficiency of your financial resources?—Oh, yes. We have promoted these county associations, and we always recommend people in the county to join the county associations. That is a detriment to our society, because where the subscribers to our society find that there is a county association, they transfer their membership to the county association, and in that way—instead of our society becoming richer, it becomes poorer.

14758. I see by the account that the previous witness put in of the Surrey Bee-keepers' Association that you do get an affiliation fee?—Yes, we get an affiliation fee from the county associations. They contribute two guineas. But for that two guineas they get more than an equivalent, because we furnish them with medals, and we furnish them with all the publications at a reduced price, and do general work that they could not do.

14759. You told the Committee that you consider your resources are insufficient. In what way do you consider they ought to be increased?—Mr. Reid has mentioned £500, and with £500 we, of course, could considerably extend our work.

14760. Yes, but £500 from what source? Where do you think you ought to get the £500 from?—I think we ought to get it from the Government. The Governments in other countries assist bee keeping very much, and recognise the importance of bees to agriculture, more especially in connection with small farmers. I could mention what is being done in other countries.

14761. Perhaps you had better tell us what other countries do?—In Germany every teacher is required to have a practical knowledge of bee keeping.

14762. Do you mean every school teacher?—Every school teacher.

14763. In primary schools?—In the public schools. He is required to have a practical knowledge of bee keeping, and there are courses of instruction lasting from three to

six days given either at the Government apiaries or the apiary of some large bee-keeper, and the instruction is entirely free. In France, also, courses of lectures are given free of cost, and in the Luxembourg Gardens in Paris there is a large apiary established and worked at the cost of public funds. There instruction is given free to anyone who likes to attend. In Switzerland the education work is carried out very fully under the control of the bee-keepers' associations, aided by grants from the Government. There are a number of experimental stations. They have 30 experimental stations in Switzerland in charge of practical bee-keepers, and observations of various descriptions are taken at these stations, and they are carefully tabulated; your lordship will know how admirably the Swiss do tabulate their statistics. These are of immense benefit to bee-keepers, and it has done a great deal towards the advancement of bee keeping on modern lines in that country. Courses of instruction are also provided free of cost.

14764. Is there a much larger consumption of honey in foreign countries than there is in England?—I do not think there is. I think we have a very fair consumption of honey here.

14765. I do not know Switzerland, but I was calling to my mind a visit to the South of France I once made. I recollect at one's first breakfast in the morning, which consisted of coffee and roll and butter, honey was always one item; but it was not produced as in England, in a pot with the jam-maker's label on it—it appeared to have come direct from the honey grower. Can you tell me whether that is so?—In the South of France, in some of the hotels, they get the honey direct from the honey growers; in other hotels they get it manufactured—what they call table honey. They do that a great deal in Switzerland also. The English tourists there have preferred the manufactured honey to the genuine, because it was not quite so sweet, so that they catered to the tourist taste. But since they have passed a law in Switzerland prohibiting adulteration and insisting on the labelling of everything with the proper name, that is gradually dying out. But it is a fact that honey is served in the South of France and in Switzerland at all breakfast tables.

14766. It seems to me when I stay at a hotel in England that the honey is on the same par with the Gruyère cheese and Danish butter and other products, that it does not come from England at all?—No, that is so, because hitherto there has not been a sufficient supply for the demand. The quantity of honey imported into this country last year amounted to £33,897 worth, and all of that honey could have been produced in this country if we could teach the people to adopt modern methods. In Belgium, I should like to tell you, bee keeping is also largely helped by grants; and at certain seasons of the year the Government places at the disposal of bee-keepers the railways for carrying their hives to the mountains or to the heather at a low rate, for the same purpose, as was mentioned by Mr. Reid, to lengthen the honey season. In Russia the Government has apicultural schools, and likewise gives grants. In our own Colonies the Governments give grants and assist bee-keepers; in New Zealand, the Department of Agriculture helps bee-keepers, and in Canada in the provincial colleges bee keeping is taught, and they likewise have foul brood inspectors paid from public funds.

14767. Which is the principal country from which we get our imported honey?—We get much honey from Switzerland and Germany, but the bulk of the honey comes from Jamaica and Cuba, although the honey that comes from those places is not as good as our own honey, because they do not take the same care in preparing it. We have been teaching bee-keepers to adopt modern methods, and not to destroy their bees as they used to. Cottagers used to destroy their bees and mash up the brood with the honey, so that you had a mixture of honey and the juices of the larvae of bees all mixed together. Now that has been done away with wherever we can reach them and teach them better methods. Although we get them to improve, there is still a great deal of prejudice existing in some places, and they will not quite give up the old methods, and so we want to send instructors to teach them and show them that the modern methods are more profitable than the old.

14768. Can your instructors assure them that if they adopt the new methods they will get better prices?—They do get better prices, as a matter of fact, and a great many cottagers are able to get good prices for their honey. In the United States bee keeping, of course, is on an entirely different footing from what it is here; it is

Mr. T. W.

Cowan.

11 July, 1907.

Mr. T. W.
Cowan.
—

—

carried out on a large commercial basis. They have immense tracts of pasturage, and some bee-keepers keep sometimes 2,000 or 3,000 hives. I visited an apiary in America where there was a bee-keeper who had 5,000 hives; and in California, where I have lectured for the State University of California on the subject of the fertilisation of fruit trees by bees, there are large apiaries of 2,000 and 3,000 hives.

14769. Have the people in California adopted bee-keeping principally for the purpose of fertilisation of their fruit?—No, the large bee-keepers have adopted it for a living, and they derive their incomes entirely from bees, but fruit growers are taking to bees for the purpose of fertilising the fruit. I can give you one instance. I was at a place near Newcastle where there was complaint that the Alexander peach trees did not produce any fruit. They blossomed freely but failed to fruit. I looked round the district, and found there was a scarcity of wild bees, and that there were no cultivated bees kept at all. I suggested that bees should be kept. My suggestion was carried out and the very next year that orchard began to yield an abundance of fruit, showing that its unproductiveness before was because of the want of bees.

14770. Where was this?—At a place near Newcastle, in California. I could mention a number of instances of that sort. In the United States they have a special department in connection with the Department of Agriculture at Washington that they call the Division of Apiculture, in charge of a superintendent, an apiarist, assistant, and bacteriologist. It is in the Bureau of Entomology. The Board of Agriculture here no doubt receives the pamphlets that they publish. They have published a great many leaflets and pamphlets connected with bee keeping quite recently, and they were all, of course, published free of cost to any who applied for them.

14771. (By Mr. Medd.) Are those pamphlets still published and distributed in the United States?—Yes.

14772. I was told that they had been almost discontinued owing to the vast expense?—I have received some pamphlets within the last month.

14773. Yes, you would probably, as what I may call a continuous correspondent of theirs, but as they were distributed two or three years ago to the institutions, and published at large, I am told that they have been almost entirely discontinued; the expense, as you know, of the bulletins, is such an enormous one?—Yes.

14774. You think they still go on?—I get the list every month of their publications, and there are a certain number of them published free and others they charge five cents or some nominal sum for.

14775. You have no idea now as to the method of circulation or cost of circulation over there?—I think the cost of circulation there is very expensive; it is done on a very lavish scale.

14776. You do not know how far it has been reduced within the last two years?—I should not like to see our Board of Agriculture here adopt the same methods that they do.

14777. This enormous effort on the part of the Department at Washington to bring everybody into touch with it has to a very large extent been abandoned. The old correspondents still receive documents, but the Board found that to go on to the extent you know they did circulate was far beyond what they could afford annually. You know that that was so?—Yes, but the Department of Agriculture in America does a great many things that we ought not to copy. A great deal of money was wasted by so large a free distribution. Some of their publications are most useful. With regard to bees, for example, just recently they published a pamphlet on diseases of bees, and likewise on queen rearing, which has been distributed gratuitously.

14778. (By Lord Barnard.) To go back to the point which we have rather wandered from, the work of your Society, have you considered that in accordance with the usual practice in this country, if your Society were to receive any assistance from the Government that as a corollary it would have to submit to a certain amount of Government control?—We should have no objection to that.

14779. Supervision, I might say, not control?—We should have no objection at all to any supervision, because all that is done is done in public.

14780. I suppose what your idea really is is this, that the Government should to a certain extent take this work up and should carry it out through the means of your Association by grant—take up the work of supervising

and assisting bee-keepers and use your Association as the means by which it did that?—Yes.

14781. Is there any other point you wish to bring to the notice of the Committee?—No, except that I would suggest that we have the machinery for doing the work and that we have the examiners for carrying on the examinations, and competent people, and we are always ready to give any advice.

14782. Have you ever thought of getting into touch with the county councils as well as the central authority?—We, in the first place, get the county associations into touch with the county councils, and we get them to apply to the county councils for grants. That was how the different associations got into touch with the county councils; it was through us in the first place, but there are a great many counties where there are no associations and the county councils in those counties either take up bee-keeping or not as they may desire, so that if we were able to get county associations in other counties we might work through them, but our centre being in London of course puts us out of touch with the distant counties.

14783. You do not do much propaganda work, do you, in the way of trying to induce those counties which have no associations to come in?—We have done up to the present, but we find now by attending different county agricultural shows that in that way we can induce people to take up the matter in the counties, and likewise through the *Bee Journal* and bee-keepers corresponding. We generally find somebody interested in a county, and if they are willing to take up the work of organising a County Association we give them all the necessary information and advice. All the counties are organised on the same basis and they work in unison with us; they have to publish their reports and balance sheets; we do not take any county into affiliation unless they do, so that we are satisfied that those counties that are affiliated to us are carrying on the work properly and the money is being properly expended, and if we find it is not we call them to book.

14784. (By Professor Middleton.) You have indicated two directions in which you would like the work extended: first you indicate that we may do a great deal more instruction in the country than we do at present?—Yes.

14785. The expert bee-keepers of this country are already in possession of information which, if it were more widely diffused, you think would greatly improve the practice of bee keeping throughout the country?—I do.

14786. So that we only require in your view money in order to provide further instructors?—Yes.

14786A. As a result of the instruction you are confident that the production of honey would be greatly increased?—Certainly.

14787. So that you would justify the application of public funds to this purpose on the ground that we would largely increase the production of a valuable product?—Yes.

14788. The other direction in which you indicated that assistance is wanted is in connection with experimental work and research, and you mentioned Switzerland as having a large number of experimental stations?—Yes.

14789. Can you indicate what the Swiss experimental stations do for the bee-keepers?—In the first place they study the different races of bees and try to find out which are the most suitable for the different regions. Then they keep a register of the weather. These stations are situated at different parts in the mountains and in the valleys, and they keep a register of the weather and the flora of the district, and then they tabulate the relations of the weather to the flora and the production of honey—the amount of honey produced by the different flora in different districts.

14790. That strikes me as essentially the kind of work that one would like the county associations to take up in this country?—The county associations, if they had the means, I suppose, would take it up, but they have not the means to do it.

14791. That particular work is not so much a question of means as of getting voluntary help from men who are interested in bees and flowers, getting them to record their observations?—We do that to a certain extent; there are a few people who do take observations and write reports of the weather and the honey they obtain.

14792. It strikes me that a central association like yours could be very useful in drawing the attention of county associations to the benefit that would be derived from such observations?—Yes, but the county associations, you see, are chiefly concerned with instructing their members in

bee keeping, and sending their experts amongst bee-keepers showing them what to do.

14793. Your colleague mentioned Mr. Brown, of Somersham?—Yes.

14794. A man of that kind would be very competent to make such observations and send them in to you?—Yes.

14795. A man of that kind could furnish you with most valuable information?—Yes, but we want 20 or 30 men to take it up.

14796. You do, but here is one man that occurs to me, in one district I happen to know?—Yes, and he would do it at once if we suggested it to him.

14797. And very likely you would find other men in other districts similarly capable. In Northumberland I came across a man who I think might also be useful in this way?—We should be very pleased to be put in contact with him.

14798. He was the secretary of the local bee-keepers association, if I remember rightly?—I have got out a notebook for keeping observations of that sort and a certain number of bee-keepers have had them, but they do not make any returns.

14799. Of course I can see the difficulty of getting these voluntary workers; still, the kind of work that you describe is essentially work for voluntary workers?—The work they are doing in Switzerland in that direction is most important.

14800. You have given great attention to the diseases of bees?—Yes.

14801. You are not a bacteriologist, are you?—To a certain extent.

14802. I understood you to say that you were not?—I do not profess to be a bacteriologist, I am a microscopist, but I have not done anything in it, lately because my eyes are not good enough for that work; I have worked with bacteria, so that I know something about them, but I do not profess to be a bacteriologist.

14803. You probably know that the investigations of the bacterial diseases of bees is a highly specialised work?—Yes.

14804. You referred to an American pamphlet which you received the other day?—Yes.

14805. Do you know the Americans have been giving attention to certain of these bacterial diseases for a number of years?—Yes.

14806. They have made very little progress?—Very little.

14807. Therefore we may be certain that if anyone wishes to take up this study he must be a thoroughly expert bacteriologist?—Yes. They have made more progress in Germany and Switzerland in connection with these diseases.

14808. Dr. Maassen and Dr. Burri you probably know?—Yes.

14809. They have given more attention to this particular subject than any others?—Yes. I know Dr. Burri, and I have been in communication with him.

14810. If any progress is to be made very competent experts would have to be engaged for this type of work?—Yes, but you want a practical man to go with them, I think; they may be good bacteriologists but they may not be good bee-keepers, and might not understand the diagnosing of the diseases properly.

14811. That is possibly the case?—You see a bacteriologist might see a larva that he would not recognise as a diseased larva unless a practical bee-keeper told him that it was diseased. When these diseases exist it is unfortunately very difficult to get at certain people—cottagers for instance—because, if they think you want to see anything about disease, they will not let you look at their bees. We have a number of people like that in the country, obstinate people, whose bees have got disease, and they will not allow any inspection of them, and we cannot get at them, although we know they are disseminating the disease all over the place. All we can do is to use antiseptic means to prevent disease, and we recommend certain things such as are recommended in this pamphlet on foul brood—what they should do to prevent the disease breaking out, but even then sometimes disease breaks out notwithstanding.

14812. Would you be in favour of legislation in connection with a subject like foul brood, for example?—Yes. Some years ago a deputation waited upon the President of the Board of Agriculture, but it came to

nothing because the bee-keepers were not sufficiently unanimous about it, and the cost was considered too great in proportion to the industry.

14813. I understand that the bee-keepers are not unanimous, and therefore I ask you whether you personally favour legislation?—Yes, personally, I should favour legislation and inspection.

14814. Do you know of any other workers in the diseases of bees in this country, other than yourself, who might be compared in any way to the foreign workers?—There is no one now. Dr. Watson Cheyne was at one time, but he is too big a man now to devote his time to diseases of bees.

14815. So that we have a great lack of expert workers in this country now?—Yes, we should like to know of some good bacteriologists who would take the matter up.

14816. That is precisely what we want to find.—That is just what we want. You see I cannot do everything myself; I am getting old, and we want some young people to come in and step into our shoes.

14817. (By Mr. Medd.) With regard to the importation of honey, are any of the cases marked as from the place of import?—I believe so.

14818. Is it a regular practice for either the bottles or the boxes in which the honey may be stored to be so marked?—We do not see the imports at all; the imports that I mentioned were from the returns given to us by H.M. Customs. We do not encourage foreign honey at all; we encourage the production of British honey.

14819. Do you not think it would help your Association to obtain a definite mark showing the place of origin in the case of each batch of honey imported?—Certainly it would.

14820. It would cause a differentiation between honey from Switzerland or Sweden or Italy or America, and so on?—Yes.

14821. After what you said with regard to Swiss honey it might cause a decline in the demand for it—I mean to say, speaking off-hand, I have no doubt the majority of the imported honey we eat is Swiss honey—or where you think it comes from?—There is a great deal of Swiss honey, but the principal honey that we get comes from Cuba and Jamaica; in fact, Cuban honey is sold as British honey very often; we know that for a fact.

14822. What I should like to see is each case of imported honey stamped with "guaranteed purity" and the place of origin. In most of the countries which import to us eggs and fruit, especially from Holland, it is all graded with regard to quality at the port of export, is it not?—Yes.

14823. If you could get that same system adopted with regard to honey it must help you, must it not?—It would be a great benefit. I have had a case brought to my notice quite recently of honey brought from Jamaica being sold as Scotch honey.

14824. That is just what I want to avoid.—Yes. That honey that I mentioned is being sold as Scotch honey, and the price charged for it is 3½d., and we know it is impossible for Scotch bee-keepers to produce honey at that price.

14825. What I advise you to do is to urge upon the Board of Agriculture the advisability of adopting that practice so as to protect both the British producer and the British consumer?—Yes.

14826. You are thoroughly familiar with Swanley College?—Yes.

14827. You do think, really, that the work as regards honey that is done at Swanley College is of value?—I think it is. They send a certain number of candidates up for examination and they pass very well. I think the instruction given there is very efficient.

14828. Hitherto we have had several witnesses speaking of the instruction at Swanley in other departments, and the verdict and experience has been identical with yours?—I went down to examine some of the candidates a few years ago, and I was perfectly astonished at their knowledge and the way they answered the questions, showing that they were well trained.

14829. Therefore you will be more astonished to know that the Kent County Council and the Board of Agriculture do not give one halfpenny of public money to assist Swanley?—I am certainly astonished to hear that.

14830. In regard to the future policy of your Association and the County Councils, I suggested to the last witness that each county might make a block grant for bee keeping and employ one or two lecturers according to the

Mr. T. W.
Cowan.

11 July, 1907.

Mr. T. W. Cowan.

—
area of its particular county. Going a step further, my own view is that to avoid complications and difficulties in the allocation of the money locally, that the Board should allocate a fixed sum, ear-marked for agriculture, and that it should appropriate it as the "whisky money" is now appropriated to each county. Would it fall in with your idea if for all the subsidiary branches of agriculture or horticulture such as bee keeping the Board of Agriculture allocated annually a certain grant?—Yes, certainly.

14831. That would secure the appropriation of that grant solely to bee keeping?—Yes.

14832. Whereas if you allocated any amount, say, £4,000 to Berkshire, for example, they might not give £1 of it to bee keeping, and another county might give a great deal. My proposal therefore is that you should urge upon us and upon others the possibility of the Board making a full block grant to cover the whole of the agricultural expenditure beyond what is annually given by the county authority, and that in addition smaller or particular sums should be ear-marked for particular branches of instruction?—Yes.

14833. You agree with that?—Yes, quite. I have some testimonials here with regard to the work of our expert if you would like to glance through them. (*Handing documents.*)

14834. (*By Lord Barnard.*) Do you print your annual report?—Yes.

14835. You have not given us a copy of it?—I have not one with me.

14836. It probably would indicate better than anything else the scope of your operations?—I will have one sent to you.

14837. (*By Mr. Latham.*) The scheme that was handed in by the last witness refers to Surrey only?—Yes.

14838. Have you any book that refers entirely to your Association?—Yes, that is the annual report. I will send you several copies of that.

(*The Witness subsequently sent to the Secretary copies of the report referred to.*)

The Rt. Hon. HENRY HOBHOUSE, called and examined.

Rt. Hon. H. Hobhouse.
—
14839. (*By Lord Barnard.*) I think most of the members of the Committee are well acquainted with your interest in and experience of the subject of agricultural education. You appear here as the representative of the County Councils Association?—Yes, to some extent, and in my capacity as chairman of the Education Committee in Somerset as well.

14840. Would you be good enough to give the Committee your views on the subject of the provision now made for agricultural and scientific instruction in the county of Somerset and the south-west of England generally?—Dealing with the higher types of agricultural education as distinct from what is given in secondary schools and lower institutions, I should say in the south-west of England the provision for that class of education is still very defective.

14841. You have no colleges or institution in the West such as other parts of England have?—No, not of a strictly public character.

14842. Has such a subject ever been mooted or considered in your county?—Yes, there were some negotiations, when the Technical Instruction Acts were first passed, between my county and the neighbouring counties with a view of establishing such a college, but it fell through because at that time none of the neighbouring counties were willing to join, and we considered that we had not sufficient funds at our disposal to establish a college all to ourselves.

14843. I suppose your county has not consulted the Board of Agriculture at all, have they—in the past, I mean?—Not officially.

14844. I dare say you are aware that the Board of Agriculture has for some time past been making great efforts to encourage counties to organise their higher agricultural work and also to advise them when necessary?—I believe that Mr. Brooke-Hunt did attend a meeting of our Committee with a view to considering the situation some years ago, but practically nothing resulted as regards the establishment of an agricultural college.

14845. Probably in the altered circumstances of the present day there is less chance than ever of it?—It is difficult now to see where the money is to come from, because other branches of higher education absorb so much of our funds.

14846. I do not know whether you are familiar with these other institutions which you see marked on that map?—Some of them.

14847. I dare say you know they all of them have ample facilities for teaching a larger number of students—certainly more of them than at present attend?—I dare say that is so.

14848. Have your county ever considered or ever practised a plan of giving scholarships to enable intelligent boys to go away to other places?—Yes, we have given a few scholarships. We have sent boys to Dauntsey, to Reading, and I think in the past, though not very recently, to the Durham College of Science.

14849. Supposing, for instance, there should be an exceptionally clever farmer's son who might probably develop either into a very high-class farmer or, perhaps, a lecturer or teacher or scientific man, are there any means by which, if his own resources do not enable him to do so, he could get the highest possible technical and scientific instruction, including, of course, a Bachelor of Science degree?—Our system of agricultural scholarships would hardly carry a man up to the Bachelor of Science degree. We do award two or three senior agricultural scholarships which are usually held at Reading, but which I think would only carry a lad up to the age of 18, hardly long enough to enable him to get a first-rate degree.

14850. I do not know quite whether you agree with me, but it strikes me as being rather a misfortune that the county of Somerset should not offer such facilities to clever lads?—I am afraid that these kind of facilities are not valued as much by the agricultural classes as they ought to be.

14851. Of course Somerset is almost exclusively an agricultural county?—Very largely so.

14852. Therefore it is probable, perhaps, that young men do not go from agriculture to other walks in life. I should have liked to have ascertained whether other classes of scholarships leading up to degrees other than agricultural degrees are given in your county?—Yes; we have a very successful course of scholarships other than agricultural ones and they are very much sought after.

14853. Then in your agricultural county, agriculturists are worse off than other people?—I am sorry to say that many, not most, of our farmers prefer to put their sons into other lines of life if they are clever.

14854. I am not familiar with agriculture in Somerset. You have no derelict land, have you?—No, practically none; but, still, the profits are not very great nowadays.

14855. Do you think it is a good plan in the case of these higher scholarships of locking up the agriculturists in a compartment by themselves?—The agriculturists are free to take advantage of the other scholarships and many farmers' sons do get other scholarships. The agricultural scholarships are given as a sort of privilege to the agricultural classes over and above the ordinary scholarships, one reason being that we found the ordinary farmer's son could not compete very successfully with the sons of other classes for the ordinary scholarships.

14856. That leads us to another question upon which we have had opinions from a great many gentlemen, and mostly to the same effect, which is that the secondary educational facilities within the reach of the farmer's son and the young man who is going to farm are not sufficiently good and available to enable him to take advantage of the higher education?—Do you mean good in the general education sense?

14857. Yes.—I think we have a good many good secondary schools in our county, but they are not most of them perfectly well suited to train an agriculturist.

14858. Many witnesses who have appeared before us

*Rt. Hon. H.
Hobhouse.*

11 July, 1907.

have stated it very definitely as their opinion that an agriculturist does not require special training in a secondary school; that the ideal education for a rising young farmer, a man of good position I may say, is that he should have the best general education that can be got up to the age of 16; that he should then go upon a farm, either his own father's farm or somebody else's farm, and for at least two years, or perhaps more, have practical experience of farming; and then that he should go to winter courses at some college or institution or attend lectures and generally acquire sufficient scientific education, which he could assimilate in consequence of his previous good secondary education to make him a good farmer?—I think ideally that is right, but practically many of these young farmers when they once leave school never go back to school again in any shape or form; and even from the point of view of giving them a taste for agriculture afterwards by keeping them in the ranks of the agriculturists, I think it is highly desirable that there should be certain secondary schools with, I will not say an agricultural side, but with an agricultural bias. I can give you an instance from my county if you wish it. We have endeavoured to foster that class of school in my county.

14859. Perhaps you will agree with Mr. Turnor, who was here yesterday and strongly impressed upon the Committee his view that such subjects as tended to a rural bias were as valuable for purely educational purposes as a great many other subjects, even though a man was not going to be an agriculturist?—I think they can be made quite as valuable in the hands of a competent teacher.

14860. (*By Mr. Medd.*) Could you now give us the instance of the secondary school to which you referred?—In our county we have three schools to which we endeavour to give this rural character by means of special grants given by my County Council, and this particular one that Mr. Medd has visited, and is acquainted with, is situate near Wedmore, in a purely agricultural district without a small town near, many miles from a railway station, and there we endeavour to influence the science teaching, in fact, a great portion of the teaching, to bear directly on rural subjects, to be illustrated rurally, and to be accompanied by practical work, both in the garden and in the workshop. I think Mr. Dymond, who has recently visited this school, and Professor Hall, who visited it not very long ago, were both very well satisfied with the results, but I am bound to add we do not find that class of work very much appreciated by the ordinary inspector of the Board of Education.

14861. The school itself is in quite a rural district, is it not?—Purely rural.

14862. Many of the children, boys and girls, attend on ponies, or bicycles, from some miles around every day?—Yes: there is no lack of interest in the school.

14863. And no lack of interest amongst the parents?—No; quite the contrary.

14864. (*By Lord Barnard.*) Do you consider that the rising generation of farmers, as a whole, in the county of Somerset are fairly well educated?—I do not think they are so well educated as they might be considering their position in the county: they are very intelligent in many ways, but, I think, they would be all the better for a little more scientific education.

14865. Does not every recognised secondary school receive some maintenance grant from the county?—Yes, in my county.

14866. I see a mention made in the report of extra grants being given?—Yes, the three rural schools I mentioned have the same capitation grants as the other schools, and, in addition, they receive £50 a year for special teaching. This information in the report, no doubt, has come from our Agricultural Instruction Committee. We have also the County Education Committee. We have two Education Committees in my County, one dealing with purely agricultural subjects.

14867. You have an Agricultural Instruction Committee as distinct from your Education Committee?—Yes.

14868. Does that Committee receive a block grant from the Council?—Yes, £2,500 a year.

14869. And is responsible for agricultural education?—Yes, for encouraging the agricultural instruction in the county.

14870. To whom do they report?—They report to the County Council.

14871. It is not a Sub-Committee of the Education Committee?—No, it is a separate Committee with a separate scheme.

14872. Are there any outside members on that Committee?—Yes; seven, I think, representing the different agricultural societies in the county.

14873. It is not a Statutory Committee at all, is it?—It is formed under Section 17 of the Act of 1902 by a scheme approved by the Board of Education: all the schemes have to be approved by the Board of Education under that Section.

14874. You consider this as educational work?—Of course—it is educational work, only a different branch of educational work.

14875. A good many witnesses who have appeared before us have not treated this subject as educational, that is to say, they have not regarded the work done by the counties under the various headings specified in this report as the education of boys and girls, but as instruction of those engaged in an industry, or of those who are just contemplating going into that industry?—Perhaps we are using educational in different senses. It is education, from my point of view, even if it is given to adults, instruction, at all events. If you teach a man how to lay a hedge, or make a ditch, that is instruction: and payment for it comes out of the higher education funds. I think you will find that is so in every county—that the payment for all these subjects comes out of the higher education funds, the "whisky money," or the rates that are levied for higher education: in that sense it is all educational work.

14876. In most of the cases that we know of it has, I think, come from the "whisky money": I do not think much of it has come from the rates?—The rates are largely levied for other educational objects.

14877. Is this use of the "whisky money" limited by Act of Parliament?—Yes, it was appropriated by the Act of 1902 to higher education.

14878. In its origin it was not, was it?—No, it was at first optional on the part of the counties, but since 1902 it has been compulsory.

14879. At any rate, whatever may be the facts at present, some people are of opinion that there ought to be a broad distinction between education and instruction as far as agriculture is concerned. Take, for instance, demonstration plots, of which we have heard a good deal in this room; do you think that they are purely educational as distinct from instruction?—It all depends on what you mean by education. As I explained before, I was using it in rather a wide sense. I should think a farmer might get a good deal of scientific education from demonstration plots if they were properly conducted. I do not wish to lay any particular stress on the meaning of the term. We thought agricultural instruction could be better administered by an agricultural body than by a body of pure educationalists. We find, as a rule, that the agricultural classes do not take a great interest in purely educational work, and that is why we have divided our committees.

14880. I will use another term—the ascertainment and diffusion of facts useful to practical agriculturists, for that after all is the purpose very largely of demonstration plots?—Yes.

14881. That is really what I mean. The duties of the agricultural lecturer in a great many counties include offering his services to agriculturists?—Yes.

14882. I do not know whether that is done in Somersetshire?—Yes.

14883. For the purpose of giving advice?—Yes; our agricultural lecturers are instructed to give that assistance.

14884. We have found that in many counties that is taken advantage of by a considerable number of farmers, and an increasing number of farmers. I do not know whether that is so with you?—Yes, I think so.

14885. I merely mention that subject as one which you would scarcely consider as educational. I do not know whether you know the scheme which Lord Fitzmaurice has established in Wiltshire, and is very keen upon developing further, of having one Agricultural Committee of the County Council who shall be charged with all duties—he would like to see them charged with all duties which would bring them into contact with one Government Department, that is to say, that an Agricultural Committee which might well have control over education, or instruction on the subjects we have just been discussing, and other matters, like allotments and small holdings, should be appointed, and act as the Executive Committee for dealing with the diseases of animals, and so on?—I think any committee in my County that dealt with all those subjects would be rather overworked.

14886. His idea was that that Committee should sit at

Rt Hon. H. Hobhouse.
11 July, 1907.
different hours in one day to perform its different functions, and that one man might perhaps be on the Committee at each of these hours, and that he would be much more likely to come to a county town if he felt he would get over all his work in one day instead of having to come repeatedly for half an hour on separate Committees?—That no doubt is true, but we can solve that difficulty by calling the different committees at successive hours on the same day. Many of the members are common to each Committee, but you do want a larger element of educationalists on the Instruction Committee than you do on the Committee that deals with the diseases of animals, and the small holdings. I think every county must judge for itself, the size of the county, and the circumstances are so different, and in my county I should not be prepared to amalgamate them all.

14887. Such a subject as that would probably involve legislation, because some of these committees are Statutory Committees?—Yes.

14888. At any rate, you are satisfied with the plan which you have. Your plan again differs from that of many other counties where the Agricultural Committee is a Sub-Committee of the Education Committee?—What was in our minds when we formed these two committees was that the Education Committee under the Act of 1902 would be overworked if it dealt with agricultural matter. That was our leading reason—the work was so enormously heavy and you cannot get the agriculturist to take great interest in that work, and the plan has not worked badly.

14889. I suppose you have a good number of agriculturists on the Committee?—Yes, a large number. The Board of Education made it a condition that we should have a certain number of the same men on both committees so as to keep up a link between them.

14890. (*By Mr. Latham.*) You find it works very well?—Yes, on the whole it satisfies the farmer, and that is the main thing.

14891. (*By Lord Barnard.*) What is the attitude of farmers in the county of Somerset towards agricultural instruction generally?—They approve of some branches of it: they approve of our dairy schools; those are cordially supported, and they approve of peripatetic instructors especially those who go round to the dairies and give instruction in cheese and butter making, and to some extent their sons attend the lectures on poultry keeping, on horticulture, and orchard culture, which is also a subject of interest in my county; but the agricultural classes are not well attended I think, and when it comes to some of the other things they do not like them. For instance we established some years ago a county experimental farm where we proposed to carry out some interesting experiments. I may say we got a grant from the Board of Agriculture for two years for the experiments carried out at that farm, but the farmers never took to it; as they expressed it, they did not think they required to be taught how to farm. It was pointed out to them that the experiments were being carried out for their advantage at the public cost, but that did not weigh with them sufficiently, and as soon as they became a majority of the Committee they proceeded to close the farm, and gave it up.

14892. You are no doubt well aware that that view among farmers was universal all over the country a few years ago, and in every county they said it was hopeless to expect, as some of them described it, college tutors to teach practical farming. That was almost the universal feeling?—There were no college tutors at our farm; the manager was a man who had had large practical experience.

14893. The Professor perhaps was?—No, there was not even a professor there.

14894. How did you carry on your scientific experiments?—The manager there of course had had a scientific training as well as a practical training, and as far as I recollect we took some advice of the Inspector of the Board of Agriculture on the subject. However, the work was sufficiently good for us to get a grant for, I think, two years, and then it had to be given up owing to this local feeling. I do not say that there were not objections to the farm, that is to say, it was not in a very accessible place, and the soil was not very good, although to my mind the poverty of the soil in a way was a recommendation.

14895. The farmers did not go because they did not see the use of it?—That is so, broadly speaking.

14896. Are you aware that the same feeling was held in almost every county in England at one time?—I believe in several of the counties of England, even at that time, there were experimental farms being tried which commanded a good deal of support from the agricultural interest.

14897. I was going to ask you whether you are aware that that feeling has steadily decreased, and the evidence we have had before us is that amongst the younger men particularly there is an increasing disposition to go to these farms?—I hope that is so.

14898. In the county of Northumberland there is a county experimental farm at a place called Cockle Park. The members of the County Council are not unanimous in its favour, and it has been seriously threatened at times, but the last time it came up the majority in its favour on the Northumberland County Council was much larger than it had previously been. I dare say you will believe me when I tell you that the number of men who go from my own part, the southern part of the county of Durham, right up to the centre of Northumberland to visit this farm is increasing year by year, and that their interest in it is developing greatly?—I know that the interest in the North of England in these matters is much greater than the interest in the South.

14899. Only it had to be created at the first, and that is what I want to direct your attention to?—At the time this farm was established I paid visits to Holmes Chapel, and one or two other institutions in other counties, and I found that the interest in the experimental farms was very great in those counties.

14900. Perhaps you did not go sufficiently far with it from the scientific point of view?—No, I do not think that was the reason. I think farmers thought that it was not practical enough, that it did not pay, and we tried to explain that it was not possible to carry on experiments and make a farm pay at the same time; at least, you would be extremely lucky if you did.

14901. Have your farmers always been in favour of dairying instruction?—Yes; there has been a very successful cheese school carried on for a great number of years through the Bath and West of England Society first, and now it is being continued by our Agricultural Committee; that school has always commanded the support and approbation of the farmers.

14902. I wonder they do not adopt somewhat of the same attitude towards agricultural instruction generally. You say, I think, that the lectures are not extremely well attended?—I think the lectures on orchard culture are well attended, but the purely agricultural lectures I do not think command so much support; it depends a good deal on the lecturer.

14903. Yes. Perhaps you will agree with the evidence given by a good many witnesses here to the effect that really the only real use of lectures is to arouse and create an interest in the subject, and that in many counties we have been told that the interest has been aroused, and the farmers will now go voluntarily, or write to the local institution or the county lecturer, and so on, for information, and that the lectures are gradually being discontinued as unnecessary?—I am afraid we have not roused sufficient interest by our lectures to carry them further; we may do so in future.

14904. Perhaps the south-country farmers require more assistance and attention than in some other districts. We have had the same difficulty in the northern and midland counties?—I am only speaking of my particular county, and I do not wish to press it too far.

14905. Is there anything more you would like to say with regard to scholarships?—I think they might be carried further if there was a greater demand for them; we do not get a large number of candidates for these scholarships.

14906. Do some farmers' sons complete their education at the elementary school, or do they complete it at a secondary school?—Many of them do not go to the elementary school; they take advantage of the secondary schools very largely, and a good many of them go to private schools.

14907. Do you think when they have done school that it is very difficult to get them to take up educational subjects again two or three years afterwards?—Yes, I think that is so with the purely farming class.

14908. We have been told by a great many teachers in these institutions, who have been before us, that they can always tell a boy who has been to a secondary school, or the boy who has not had a good secondary education, even though the well-educated boy may have forgotten some of the things that he learnt at the secondary school?—Yes, I should think a good secondary school education is bound to leave some trace behind it in after life.

14909. Which could be developed by means of winter courses, for example, afterwards?—Yes.

14910. You have never had any winter courses?—No, there has never been any demand for them.

14911. We have been told that sometimes the courses create the demand. Is there anything else that you would like to add?—I should like to emphasise the fact that all the way through this subject a very great deal depends on the training of the teachers. One reason why there is not more rural instruction, if I may so call it, given in our secondary schools is because of the lack of special training of the teachers.

14912. Do you mean teachers in agricultural schools?—I am speaking now of teachers in schools generally.

14913. In all classes of schools?—In both the elementary and the secondary schools, to my mind. Of course, those men, as a rule, know very little about agriculture, and have had very little training in agricultural science, and it is only the exceptional kind of man who is able to give this kind of rural instruction satisfactorily. Therefore you really must go back to our training colleges if you wish to make any impression on these boys in these subjects.

14914. You have great experience on these subjects, and I should like to know what your opinion is on another question connected with that point. We have been told by more than one witness, I think, that the curriculum for teachers in training is already so crowded that it is absolutely impossible to add any additional subjects, and that if you were to give them training in agricultural topics you would have to knock something else out. Do you think that is the case?—I am afraid, so long as their training is limited to two years, there is a great deal of truth in that. I think if you could give them an extra year on topics of this kind, at an agricultural college especially, you would produce a class of teacher who would be extremely valuable. That was one of the subjects we proposed to the Board some years ago. I was the chairman of the Departmental Committee a few years ago, which inquired into the curriculum of the training colleges at the request of the Board of Education, and we did succeed, I think, in getting elementary science adopted as a permanent integral part of the curriculum, so that every teacher ought to know something of nature study and a little of natural science. That previously had been an optional subject. Then we recommended that among the extra optional subjects which are taken up by many teachers should be included one which might be called rural subjects. We drew up a short syllabus of it, and any teacher passing in that subject would get a mark of distinction, and would be known afterwards as having some special knowledge in that class of subject. I believe that still is in the training college syllabus. I am not quite sure, because it has been so often altered; but it was a short time ago. Very few teachers take it up, however, the main reason being, I think, that it is not sufficiently recognised by the local authorities as a subject for which they ought to pay a teacher extra, and not only that—I am speaking now of elementary school teachers—teachers who are trained in Government colleges do not like labelling themselves as rural teachers; most of them desire to go into big towns to begin with. They think they will get higher salaries, and they know they will get advantages, social and otherwise, which they will not get in rural districts.

14915. I have ventured in several cases to allow this subject to be touched upon because so many of the witnesses have pressed upon us, and I think you seem to agree, that it is absolutely necessary, if you are going to have intelligent agriculturists, that they should have some agricultural teaching in school?—Of course you would have to equalise the salaries both in town and country.

14916. That would be very costly?—No doubt, but it is done in France.

14917. (*By Mr. Medd.*) Do you not consider that such training as is useful for rural teachers is equally useful for urban teachers and has a right to form part of the general curriculum—in fact, it does to-day?—I think it would be an advantage to any teacher to know those subjects, but of course the time for training is limited, and if a teacher wants to be a specialist in another branch he cannot be a specialist in rural subjects.

14918. What I mean rather is this, that there is no valid excuse for saying that any pupil teacher should not be acquainted with the common phenomena of nature?—No, and I should hope that under the new system of training pupil teachers in secondary schools that they will all get some acquaintance with natural science and nature study.

14919. You know probably better than I do the provisions in the latest regulations for the training of teachers?—The last only came out yesterday.

14920. Then it would be the one before that because I have not seen that one?—I know there are excellent opinions and exhortations in all those.

14921. In the memoranda of the Board itself there is nothing to prevent the teacher who is to be an urban teacher from acquiring just that type of instruction which we want in the rural teacher?—There is nothing to prevent him but there is not much to encourage him.

14922. (*By Lord Barnard.*) I do not know whether you have ever heard it, I certainly have never heard any suggestion made to the effect that urban teachers would not receive benefit from a training in rural subjects. I have never heard that suggestion made anywhere and unless it has been made it seems to me we are fighting the air. Have you ever heard such a suggestion?—I have heard objections on the ground of time in taking up such subjects.

14923. Yes, but not with regard to the merits?—What you really want is a direct inducement to teachers to take them up.

14924. You are intimately acquainted with the Agricultural Education Committee?—Yes, I was one of the original promoters of it and acted as honorary secretary throughout its active existence.

14925. Would you like to direct the attention of this Committee to the report of that committee. Is it still in existence?—It is not in active existence. I could state shortly what the objects of that committee were and our main lines of action.

14926. If you please.—The objects of the Committee were stated to be two, first to secure systematic and efficient instruction, both theoretical and practical, in agricultural subjects suitable to every class engaged in agriculture, and, secondly, to diffuse among the agricultural classes a more thorough appreciation of the advantages of instruction bearing directly or indirectly on their industry. Of course, that was a very large programme. We first took up the subject of the elementary school and there we endeavoured, and successfully endeavoured, to get a block grant given which left the teacher free to develop such subjects as might be most suitable in the country districts as well as in the towns. We got the block grant after a good deal of negotiation in, I think, 1901. Then we got included, it was largely due to our representations, among the ordinary subjects of the curriculum what is generally known as nature study and under that may be taught any subjects bearing on country life. I believe that is done in a great many schools at present. That could not very well be done until we had got a block grant system. Then going on to the secondary schools we endeavoured to get a special course in rural science recognised by the Board—it was then at South Kensington—and we got that put in. Sir William Abney was very helpful on the subject, and it was a practical course such as I have described at some of these Somerset schools. It was the same kind of course but, unfortunately, it has disappeared from the secondary school regulations now owing to the much greater freedom that is given to all those schools now to teach what they like, and there was no need, I suppose, to keep any very special course, and the record of it, therefore, has disappeared, which is rather unfortunate, because it formed a sort of model course for the secondary schools in the country districts. There were also courses drawn up by us for the nature study teaching in the elementary schools, so that we set the ball rolling in both those respects. Then we endeavoured, as I think I have told you, to get the curriculum of the training colleges altered and through that Departmental Committee, we did something with regard to that. We communicated with all the local authorities who were then some of them rather at a loss how to spend some of their technical instruction money, and we sent them all kinds of suggestions as to how it could be best spent on agricultural objects. I dare say that did some good: I am not prepared to say how much. Then the other class of our work was still more difficult: it was to diffuse among the agricultural classes a more thorough appreciation of the various forms of instruction. I had several pamphlets written by authorities on agricultural education and published in a large number of newspapers all over the country. I think 40 or 50 local newspapers published them week after week and in that way I suppose we did something to influence public opinion. Of course we had not at our disposal funds to carry on a great lecturing system, and we had to suggest that to the local authorities to carry out, but in all those ways we attempted to bring the agriculturist more into contact with scientific education, and to provide more suitable education for him. Our work went on for three years. At the end of that time the Act of 1902 was passed and I and most of my

Rt. Hon. H. Hobhouse.

colleagues were so overwhelmed with other kinds of work that we had to drop that particular work which then, in my opinion, became the work of the central department. We did our best to get the Board of Agriculture and the Board of Education to co-operate on that subject, but I cannot say it was altogether crowned with success.

14927. You have familiarity with Government departments generally, I think?—From the outside, as a Member of Parliament: I have never been inside a Department officially.

14928. Do you know an instance of any Government departments co-operating? I was 10 years in a Government department and five years of that time I was Secretary to the Chief, and that led me into a great many Government Offices, and I cannot call to mind any instance where two Government departments were in any way concerned with one subject?—I could not tell you without some thought. This was a subject which so intimately concerned both departments. Perhaps I might add, as bearing on your question, that our committee felt the great difficulty of co-operation between two different departments so much that, in the first instance, we proposed that the whole of the agricultural work should be transferred to the Board of Education in the first instance. Mr. Hanbury entirely rejected the idea, and we found it was not very acceptable to the agricultural classes. We dropped that, therefore, and then we suggested among other things that there should be some joint committee formed at head-quarters to deal with those subjects, on which both Boards should be represented. I do not think that was ever carried out.

14929. Would you like to express an opinion on that subject now as to what your views are on that point. I must assume, of course, that if the Government has to provide funds that those funds must be administered subject to the supervision of some Government department?—I still think it is most desirable that the two departments should work in close co-operation because after all you cannot divide education into water-tight compartments. For instance, you have the connection between the rural instruction in secondary schools in country districts which ought to bear more or less on the instruction which is given in higher institutions of an agricultural character, and if you have one supervised and inspected by one department, and the other supervised and inspected entirely by another department, you will never get thorough co-ordination.

14930. I should like to ask you one question with regard to fisheries. I do not know whether you take any interest in fisheries?—We are not a fishing county.

14931. The Armstrong College at Newcastle have now commenced marine work, and have got a marine laboratory at Cullercoates, partly through the munificence of a gentleman who is interested in the subject, and partly through the efforts of some of the professors and teachers in the college. Would you suggest that that work should be supervised by the Board of Education rather than by the Board of Agriculture and Fisheries, merely as a test?—I should not think that that was a branch of work that the Board of Education could take up usefully, but really my opinion on fishery questions is worthless, and I would rather not give evidence on it.

14932. It is rather on the principle as to which body should take up and carry out research work?—If there was a joint committee I should have thought that it might take a general supervision of all that class of work. I believe there is a body in Ireland which does that. Those who are best qualified upon the committee to deal with research work would deal with research, whilst those members best qualified to deal with the curricula of the schools would take that branch.

14933. You think there should be co-operation?—I think it would be most valuable from every point of view. There is nothing more trying to local authorities than to have to deal with two different Government departments about the same thing, or substantially the same thing, and finding them take different views.

14934. In shadowing forth the idea of a joint committee or council appointed by the two Departments, would you suggest that there should be outside members on such a Committee?—I think we suggested that there should be some advisory body, not an executive body, with which such a Joint Committee might take counsel. I believe they have something of that kind in Dublin.

14935. We have had that suggestion made by two or three witnesses, and I understand you would approve?—Yes, but, I think, such an advisory body ought to contain both agriculturists and educationalists.

14933. Do you think that representatives of every county should be included in such a body?—Not necessarily; that might make it too large.

14937. I understand you have always considered that the Government should have taken a more active part in establishing first-class institutions for the teaching of scientific agriculture?—I think there was a time when much more progress might have been made in agricultural education if the Government had acted more boldly in taking, what I may call, central action, instead of leaving the disposition of the "whisky money" entirely to the control of the local authorities. A great opportunity was then lost of establishing really first-class institutions for the teaching of scientific agriculture, as has been done in many foreign countries. Now, of course, these funds could not be withdrawn as they have been entirely appropriated, mostly to non-agricultural objects. Unless further funds were provided I am afraid that in many parts of England, and certainly in my part of the country, it would be difficult to establish first-class agricultural education institutions. The Government might, however, find funds in a small way as they did lately in the case of the National Cider Institute, and could take the lead in getting counties to combine. I think something might still be done in that way.

14938. You think there is great scope for the Government to take the lead and to advise, especially in the work of co-ordination?—I think local authorities are always glad to have a lead in the right direction from Government departments. They object strongly to minute regulations, but that is quite another thing.

14939. They want rather a lead and advice?—Yes.

14940. I think your evidence on that point agrees with that of several witnesses, who have suggested that the Government should be the moving spirit in the work, but that the actual administrative work, such as the appointment and payment of all teachers and officials, &c., should be left to the local authorities?—Of course, if the Government contributes largely to an institution it would have a perfect right to a voice in the principal appointments.

14941. You think it should have representatives at all events?—Yes, as in the case of the Cider Institute, where they have a voice in choosing the directors, &c. That Institution is working very well and it is carried on by a combination of several counties under Government guidance.

14942. I suppose you think the work should be more co-ordinated than at present. We understand that there is a good deal of overlapping in experimental work, and it has been suggested that the Government might give its grant on condition that it is informed what work each institution would take up, and in such case that overlapping might not happen?—I think there is a good deal of waste of money in experimental work. On the other hand, it must be remembered that sometimes seeing is believing, and if you can have demonstration plots and that kind of thing, they do good locally.

14943. We have had a clear line of distinction drawn between experimental plots and demonstration plots; the latter are intended to demonstrate known facts and the former to ascertain new facts?—Yes.

14944. Many farmers seem to think that the more demonstration plots there are the better?—Yes, provided they are conducted on scientific principles. I think some money is wasted now owing to the way in which they are conducted. A good deal depends upon how the county instructor advises and lays out the experiments. Some of them seem to be rather worthless. There is need for good scientific supervision in order to make them thoroughly useful; for instance, a Government inspector might go round and inspect the conditions under which the experiments are carried on, and if he points out what are known to be fallacies he will be doing good.

14945. (By Mr. Latham.) You made some allusion to the feeling of farmers against scientific teaching. Don't you think that largely comes about through not having the right man to carry on the instruction?—Yes, no doubt that is often the case.

14946. So that after all the fault is not quite so much with the farmer?—I don't blame the farmers much. They are practical men and look at things from a practical point of view.

14947. My experience goes to show that if you have as lecturers sound men who are practical and also scientific teachers their work will be appreciated?—Yes, probably, but farmers are very severe critics of lecturers.

14948. (*By Lord Barnard.*) I have been rather led to believe that the prejudices of farmers can be removed, and, in fact, are being broken down?—Yes, and I hope that with the more scientific education now given to farmers' sons a great deal of the remaining prejudice will disappear.

14949. In course of time the supply of competent and suitable teachers will no doubt be increased, and experience will be gained not only by teachers but by county authorities. In fact, do you not agree that the facilities given have not yet been long enough in operation for them to acquire a definite and final form?—I hope we shall improve as years go on, but I certainly think that parts of the country require a stimulus from headquarters.

(*Mr. Medd.*) I am not a farmer or a teacher, but I have addressed many meetings of farmers in different parts of Gloucestershire and Cheshire; and I have always found their desire was to profit as much as possible by any good teaching they could get.

14950. (*By Lord Barnard.*) Are you in favour of winter schools?—Yes; I think they would do a great deal of good.

14951. In what sort of buildings would you hold them: would you hold a winter course in an existing building?—Yes, if you can get a suitable building. I presume there would have to be some apparatus for teaching science.

14952. Would you contemplate the erection of a winter school?—I should hope it would not be necessary to build. The less money you spend on bricks and mortar the better.

14953. Are there many small holders and small occupiers in your county?—Yes; we have a certain number in Somerset, but we have also a large number of big farmers.

14954. Can you treat both classes together, or should they be separately dealt with?—I don't see why both classes should not attend lectures or go to winter schools together, but I think you may find that the larger farmers' sons are less keen about attending these courses than those of the smaller holders would be. I might perhaps here be allowed to add that I think something might be done to promote co-operation in this matter between the agricultural societies and the local authorities.

14955. Are the agricultural societies in Somersetshire societies in anything beyond the name, or are they simply bodies for running an agricultural show?—Many of our societies merely run a show and do nothing else. Others do more. My Agricultural Committee gives some of them grants for holding demonstrations in milk testing or for giving lessons in hedging, ditching, shearing, &c. A good deal of that kind of work may be done through the instrumentality of the local agricultural societies.

(*Mr. Latham.*) I think societies do not undertake this work as a rule not because they do not wish to do it but because of the difficulty often experienced in getting thoroughly qualified instructors and lecturers in whom the farmers can have thorough confidence.

14956. (*By Lord Barnard.*) Do you consider instruction in poultry keeping of value?—Yes, it is popular in my county.

14957. Would you say the same of bee keeping?—I should think that would be valuable also for certain classes of people.

14958. We have had very opposite opinions expressed by some witnesses on that subject?—I think it is a branch of horticulture and probably valuable not so much to the farmers as to the cottagers.

14959. (*By Mr. Latham.*) A witness to-day has told us he has little doubt that in many instances bee keeping is productive of produce—increases the production by fertilising the soil?—I am not scientific enough to say whether that is so, but I suppose there should be a certain number of bees in a well regulated garden.

14960. You said it was more a cottager's question?—I meant because farmers do not as a rule keep bees.

14961. But do you not think they ought to do so?—The farmers don't care much for *petite culture*. They have so much to do in the larger branches of husbandry.

14962. The bee keeping is usually managed by a farmer's wife or daughters?—No doubt.

14963. (*By Lord Barnard.*) Have you considered the subject of farm hygiene?—I assume you mean by that the health of the animals on the farm.

14964. Yes, my question would include that?—Yes, it is a proper subject for an agricultural instructor. We do give some lectures on these subjects.

14965. Are the lessons in farriery considered of importance?—They may be very useful.

14966. That is a manual process?—Yes.

14967. Have you school gardens?—Yes, we have had school gardens in connection with our evening schools for some years at certain centres. They have answered extremely well and now we are starting a system of school gardens in connection with our day schools. Some of the secondary schools have them.

14968. You think that sort of thing ought to be extended?—Yes, it would be useful to every class.

14969. (*By Professor Middleton.*) I understood you referred to the apathy of the farmers?—I did not use that word.

14970. Perhaps I put it a little too strongly, but I understood you to say they do not quite appreciate the agricultural instruction?—Not certain forms of it.

14971. So far as I could gather they appreciate most forms of it except the teaching of agriculture proper. For instance, they appreciate lessons in dairying, &c.?—I have often heard the remark made that a school is not the place to learn agriculture, and to some extent I agree with that view.

14972. I gather from the general trend of your evidence that you think you would probably have done better in the West of England if you had started with a central institution?—I do, because from that central institution it would be comparatively easy to take up other branches of work.

14973. You expressed the opinion that Government should have taken a more active part in establishing first-class institutions for the teaching of scientific agriculture. In using the word "Government" in that connection do you mean the Board of Agriculture?—That would have been the natural department to take it up, but in order to do so they would have needed some of the "whisky money" or other funds.

14974. The money was granted to the County Councils and then the Board of Agriculture, without sufficient funds, was left to look after agricultural education?—I think it was a great opportunity lost.

14975. I suppose you now recognise the fact that unless further funds are made available we are not likely to be able to effect much, even if we have an advisory committee, and even if our system were perfect, without funds we are not likely to get much further forward?—Much more weight is given to the advice of a Government department if it is accompanied by a promise of funds.

14976. With regard to scholarships I understood you to say that you had a complete system of general scholarships in Somerset—what are called major and minor scholarships?—We call them junior, intermediate, and senior scholarships.

14977. Are these open to all boys who belong to the county or who have lived there for a certain number of years?—That is not quite accurate. Our junior scholarships are confined to boys from the public elementary schools. The intermediate ones are partly open and partly confined to the same boys in the secondary schools, and the senior scholarships are open to all boys residing in the county.

14978. Boys possessing the senior scholarships can, I suppose, go to any approved institution?—Yes.

14979. These scholarships are, of course, available at any agricultural college which the holder chooses?—Yes, if it is an agricultural college of a high enough type, but as a rule the holders of the scholarships do not choose agricultural colleges.

14980. I think you referred to the lack of co-operation between the Board of Education and the Board of Agriculture. I should be glad personally to promote such co-operation, and I should like you to explain a little more fully in what ways you think there has been lack of co-operation?—I am afraid I am not prepared just now to go into all the history of the matter.

14981. But you might indicate in what respects the lack of co-operation shows itself?—When my Agricultural Education Committee was formed we felt it was desirable to introduce a more agricultural or rural element into education in the county districts, but the question arose, who was to do it. We found that the Board of Education then had no agricultural element in it, whereas the Board of Agriculture had nothing to do with any kind of education that was not purely technical. It seemed to us that the only way to achieve our object was by means of some

Rt. Hon. H.
Hobhouse.

11 July, 1907.

Rt. Hon. H. Hobhouse.
 11 July, 1907.
 co-operation between the two departments. We suggested the formation of a joint committee for such subjects as drawing up a rural course for the secondary schools or securing adequate inspection in the more agricultural subjects. We thought such co-operation might be useful.

14982. No doubt you are aware that the Board of Education have now appointed an agricultural inspector?—Yes, one, a most excellent man, but he cannot do all the work that is necessary.

14983. And the courses of study have been remodelled very much in accordance with the recommendations which I think your Committee suggested?—Something has been done in that way, but if further progress is to be made I think that the agricultural element in the Board of Education will have to be still further strengthened.

14984. But what has been done does not seem to imply any lack of co-operation. I understand you would agree that the line of development is right, but you think the Board of Education have not yet gone far enough in appointing a sufficient number of inspectors?—I think they ought to enter into consultation more with the central authority on agricultural subjects.

14985. No doubt the Board of Agriculture was consulted in regard to the appointment of an agricultural inspector?—Yes, but I think the departments might co-operate more upon such subjects as the regulations drawn up for secondary schools, &c., but I don't wish to speak with any great authority upon that subject.

14986. You referred to the fact that local authorities do not like dealing with two departments. Of course I can quite see that it would save some trouble and be preferable to them if there was only one department to deal with, but the question is whether a single department would be an advantage from the purely educational point of view?—It is very distracting to educational administrators if they are pressed from one side by a purely educational authority and on the other side by a purely agricultural authority. There are branches of work in secondary schools that require the supervision of persons versed in the subject from both sides, and though it is quite true that there is one inspector in agriculture now appointed by the Board of Education, I don't think he weighs as much, so far as I know, in the allotment of grants, &c., as do the ordinary inspectors of the Board who know little or nothing about agricultural work.

14987. (*By Mr. Latham.*) I am rather disappointed to hear you say that the agriculturists in your districts are rather against receiving instruction in their business. I happen to have had a great deal to do with the Bath and West of England district, and I understand that in some directions you were rather pioneers?—I excepted the dairy industry.

14988. When classes were started in Somersetshire, were they not taken up well?—They were taken up well in the cider industry; poultry was also dealt with rather successfully.

14989. Is there not a good deal of research in connection with the Bath and West of England Society, indeed one of the best essays on cheese-making—that of Mr. Lloyd—came from your district?—Mr. Lloyd does not live in our district.

14990. He wrote it upon the evidence he got from the Somerset Cheese School?—That is a flourishing institution.

14991. If all these efforts have been so far successful, and if the farmers appreciate them, don't you think they would also appreciate education of a scientific character placed before them on similar lines?—I hope they may still do so, but we have not hitherto found our lectures very successful.

14992. With reference to the remark you repeated that the school is not the place for learning agriculture, with which I agree, is it not a fact that the college or school must be the place for acquiring a scientific education?—I quite think so.

14993. If you had something of the sort in your district, would it not be a great advantage to the district?—I have always thought so.

14994. Do you think the farmers would be against it?—I don't think they would be in favour of spending any large amount of county money upon it. I may be wrong, but that is my impression.

14995. If we could get a considerable Government grant, could you not also find some local funds?—I think we should be more likely to get money from the county ratepayers if there was a promise at the same time of a substantial Government grant.

14996. Do you agree that the money now expended on agricultural education in this country is too meagre?—

Yes, upon certain branches, the highest branches, of agricultural instruction.

14997. With reference to the differences of soil, and even of climate, do you not think that if the experiments were carried out upon a wider scale and upon broader lines, they would create more interest?—Possibly so; there are manuring experiments carried out in different parts of the county which excite some interest.

14998. Are they not rather meagre?—Yes, and I have always felt that we could not do much more without a central institution, but practically that kind of work is now left to the Agricultural Instruction Committee, the majority of whose members are practical farmers.

14999. Does the expenditure of £2,500 a year include all the agricultural teaching?—Yes, all the purely agricultural instruction, but the same class who take advantage of it can get their share of other branches of our educational work. They are not debarred from going to our secondary schools or evening schools, or from our ordinary scholarships. If we could have an institution like the Reading College in our midst, I should be glad to promote it, but that requires the co-operation of different counties.

15000. You remark that a distinctly rural character is sought to be given to three of your secondary schools by a special annual grant in consideration of the governors providing gardens and experimental plots, and special science teaching bearing on agriculture; so that you really do encourage the teaching of agricultural science in these three schools?—Yes. I may explain that we started that at my suggestion at a time when South Kensington held out special inducements for that kind of work, and one of the conditions we made was that the arrangement was not to be interfered with without the consent of the Education Committee. No objection has so far been taken to it, but whether it is warmly approved or not I am a little doubtful.

15001. Do some of your scholarship holders go on to Reading?—Yes, we have one scholar at Reading now.

15002. Did I understand you to say that they could not stop there after 18 years of age, because I did not know of such a rule at Reading?—I did not say that with regard to Reading generally, but I don't think our scholarship carries him beyond 18.

15003. Then the limit of age is at your end of the arrangement?—Yes. Scholarships are awarded at a certain age and are tenable for two years.

15004. If a boy shows special scientific aptitude, could he not go on longer and further?—In special cases we might give the necessary grant to continue a very promising boy who was working for a degree. I have already explained what we have endeavoured to do with regard to the secondary schools, we cannot make them all agricultural, but we have picked out three to which we have tried to give a special agricultural character.

15005. (*By Mr. Medd.*) Does that include a girls' school?—No, there is also a girls' school, but I would not call it agricultural; it is rather horticultural, and I think there should be horticultural teaching given in connection with every school.

15006. Is there a demand for more money for agricultural education?—If more money is given, it ought to be given to the higher forms of agricultural instruction, which are most likely to be neglected in the counties, I think that is what the Government ought specially to encourage.

15007. (*By Mr. Latham.*) I am afraid that would rather shut out the small farmers?—The clever sons of any class of farmers might very well take advantage of it.

15008. My experience does not show me that as a rule the clever men come from the class of small farmers?—We have had some remarkable instances of clever boys from every class.

15009. You suggest liberal grants to winter schools conducted upon thoroughly efficient, but not scientific lines?—Not highly scientific. What I meant was that the winter schools, if they are to attract the young farmers generally, should be of a practical character. There must be some science, but they should not be purely scientific. If young men have been on the land for several years, I do not think they will have much science.

15010. Is there not a good deal of science in the adaptation of certain manures to particular classes of land?—That is applied science.

15011. Are there not great mistakes sometimes made in the application of certain manures to unsuitable land? And would it not be an advantage if young farmers could have some education in that respect?—I agree.

15012. Lord Barnard made a remark with regard to draining which we were told by one witness is a landlord's job, but, if that is so, does not the landlord generally employ his tenants to do it, and on that assumption do you not think that draining is an excellent thing to be taught?—I think the principles of draining should be taught.

15013. Does your Committee give prizes for rick building, ditching, hedging, etc.?—I think we allow certain prizes at the end of the course.

15014. Do your teachers go out to demonstrate upon those subjects?—We have done that, but now we leave it pretty much in the hands of the Agricultural Society to carry out. We give them a grant, and they make their own arrangements.

15015. (*By Mr. Medd.*) I hand you a copy of the resolutions of the Agricultural Education Committee. I questioned Sir Thomas Acland upon them, and he agreed with them with the exception of No. 5, which he objected to on the ground that a permanent demonstration station in each county would be useless, because of the differences of climate, temperature, etc. in particular areas. How far would you regard these resolutions as affording a practicable policy?—I have dealt with most of them already in my evidence.

15016. But, taking them as a whole, do you approve of them?—Generally speaking I do.

15017. Is it not the essential point to begin with that there should be absolute co-operation between the Board of Agriculture and the Board of Education?—I think that is most important, taking the word education in its widest sense.

15019. Differentiating education from instruction?—Yes.

15020. Professor Middleton seemed to imply that there had not been any obvious lack of co-operation?

(*Professor Middleton.*) So far as known to me.

15021. How would such a course as this recommend itself to you, that the central authority should annually appropriate a sum to each county for agricultural purposes, earmarked for such purposes, instead of leaving each county to appropriate as much as it likes of the "whisky money" for agricultural purposes?—I don't think it would be wise to let the counties off without contributing out of their own funds to such purposes.

15022. The distribution from the central authority might be made to depend upon a contribution locally of an equal amount?—I think you must make some condition of that kind in any central grant.

15023. At present nothing is earmarked for agricultural education purposes, except the small amount given by the Board of Agriculture to particular colleges, and therefore those parts of the country which have no institutions of that kind cannot get in because they have not locally the money necessary. My object would be to enable the Board of Agriculture to allocate larger sums annually to each county for agricultural purposes, one condition being that an equal sum should be contributed by the local authorities?—I think such grants should be confined to those higher branches of agricultural instruction which counties have in many cases shown themselves backward in supporting.

15024. The final object of this Committee is to obtain more money for the purposes of agricultural education and to show how it can be usefully appropriated. It seems to me that one of the most feasible schemes is for the Board of Agriculture to have allotted to it by the Treasury a fixed sum for agricultural education, which it distributes to the various counties according to their size, population, etc., upon condition that an equal amount is contributed locally?—Yes, but I think it should go further than that. If you give a substantial grant to a county you might do it on condition that they submit a scheme which can be approved by the central authority and you should take care that the scheme provides for a sufficient support of the highest types of agricultural instruction.

15025. Subject to these conditions, would you think such a plan as I suggest feasible or desirable?—It is feasible, if you can get the money from the Treasury.

15026. Would you as a chairman of a county council object to submit a scheme for the agricultural education of your county to the Board of Agriculture annually?—On consideration of receiving a liberal grant. Putting, aside all prospect of a Government grant, I should have no objection as the head of a county authority to consulting the central authority; but I should object to be absolutely bound to obtain their approval of our scheme of work, for I think the county authority ought to have as free a hand as possible in administering the county funds.

15027. But the money is not always expended to the best advantage?—Still, you must have regard to local feeling in administering local funds.

15028. I do not suggest that the Board of Agriculture should control your scheme or have even any absolute power of revising it, but you might submit it for advice and consideration?—I would have no objection to that.

15029. Would you be in favour of a consultative committee in London, including representatives of groups of counties and great agricultural societies?—I have already said that an advisory committee would be useful, provided that there were central funds to distribute.

15030. But irrespective of funds?—Then I don't understand what they would consult about.

15031. About the formation of schemes, for instance?—I have already said that I don't think the schemes ought to be subject to the absolute approval of the central authority unless it contributes funds.

15032. Might not such a committee be useful in regulating the relationship of different counties and bringing pressure to bear on the Board or upon the Treasury?—I don't think it would be worth while setting up such a committee unless there were more funds to distribute, but I have not thoroughly studied that point.

15033. Are you aware that there has been a project for converting Cirencester into a collegiate centre?—I have heard so.

15034. And of making Bristol or Oxford or both into collegiate centres?—I have heard that.

15035. Do you think Somerset would be inclined to co-operate?—Personally I should be inclined to co-operate, but I cannot speak for my Committee without consulting them.

15036. (*By Lord Barnard.*) You expressed an opinion that the county authority should have the sole control of spending county money, but what we had in contemplation was that the county authorities might have the spending of some national money as well. Would you object in that case to some degree of central control?—I should not.

15037. In the same way as in the case of elementary education?—Personally I should advocate any new national grants for agricultural instruction being administered under the control of a central authority.

15038. The idea put forward by some witnesses is that it should be administered by local authorities, subject to a certain amount of central control, in the same way as the elementary education grants?—Yes, under some degree of control from a central body, but that answer does not apply to the funds that are now actually being administered by the local authorities, which they rightly regard as their own.

15039. (*By Professor Middleton.*) Has the County Councils Association which you represent considered at any time the expenditure made by the different counties under the various headings of agricultural education?—No.

15040. You are not in a position to give the views of the Association upon the expenditure of the different counties?—The Association has no collective views upon that.

15041. There is no criticism by the Association of the expenditure of different counties?—No; the Association is not in a position to criticise that.

(*Lord Barnard.*) Thanks for your evidence.

TWENTY-NINTH DAY.

Tuesday, 16th July, 1907.

PRESENT :

The Lord BARNARD (*in the Chair*).

The Lord BELPER.
Lord MORETON.
Mr. F. D. ACLAND, M.P.
Mr. DAVID DAVIES, M.P.
Mr. THOMAS LATHAM.
Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.
Professor W. SOMERVILLE, D.Sc.
Mr. H. S. STAVELEY-HILL, M.P.
Mr. A. E. BROOKE-HUNT (*Secretary*).
Mr. H. L. FRENCH (*Assistant Secretary*).

Dr. WM. SOMERVILLE, Professor of Rural Economy, Oxford University, examined.

Dr. W.
Somerville.
16 July, 1907.

15042a

15042b

15042. (*By Lord Barnard.*) Will you kindly give the Committee such information on the subject of agricultural education as you think will be useful to us?—I propose to confine myself entirely to giving a brief outline of the present position of affairs at Oxford. I can, of course, supply information with regard to other departments with which I have been associated if desired; but that is a matter for the Committee to question me about.

The so-called work of agricultural education, and education in rural economy at Oxford, centres round a chair that was established in the year 1796 by the then Professor of Botany in Oxford, Dr. Sibthorp, who in that year bequeathed to the University an area of land for the endowment of a chair of rural economy. At that time I believe the income from the land was approximately £200 a year, and the income was fairly maintained at that level until the depressed times of the late seventies arrived. Since then I think that the clear income from this endowment has probably not amounted to more than about £120 a year. From the time of the establishment of the Sibthorpean Professorship in 1796 until 1884 the chair was pretty well amalgamated with the Professorship of Botany, and was never held independently by anyone until 1884, when Sir Henry Gilbert was appointed Sibthorpean Professor of Rural Economy. What exactly happened before that time I have not been able to ascertain. I doubt if any special lectures on rural economy were ever given until Sir Henry Gilbert took up the work in 1884, and held the post for two periods of three years each, resigning in 1891. He gave courses of lectures, chiefly, of course, concerned with the results obtained experimentally at the station at Rothamsted. Then from 1891 to 1894 the chair was filled by no one; the income during those years, I believe, being appropriated for the maintenance of the farm buildings, and for the provision of some necessary improvements on the estate. In 1894 the University proceeded to make another appointment, placing Professor Warrington in the chair. He held the appointment also for two periods of three years each, resigning in 1900. After 1900 nothing was done until 1906, when I was appointed to the professorship. Practically that is all that occurred down till the present time; but in 1891 the Hebdomadal Council, taking note of the revival in agricultural education that was then present in the country, appointed a committee, the terms of reference by the Hebdomadal Council to the committee being to consider in what way the University could assist in the establishment of agricultural education with a view to the needs of county councils. That was practically in the first year of the work entrusted to county councils under the Local Taxation (Customs and Excise Act) of 1890. This Committee, appointed on April 27th, 1891, reported on June 18th of the same year, and they recommended that specialised agricultural teaching should be started in the University of Oxford, and that the existing science courses should be utilised as a foundation on which this specialised

instruction should be based. They proposed that the emoluments of the Sibthorpean Professorship should be somewhat increased, and that he should be provided with a technical assistant. However, although this was unanimously recommended, no action whatever was taken upon it, and, so far as I can learn, the reason that nothing was done was because at that time—namely, in 1891—the University was in considerable financial straits, and as the proposal involved expenditure of money, the University did not seem to see its way to proceeding with the work. I do not really see why this should have been a valid reason for doing nothing, because at that time, of course, other educational institutions that were undertaking agricultural work were being supported by County Councils, and were being placed in the receipt of grants by the Board of Agriculture. It seems as though the University at that time were taking a very despondent view of things in general, and did not appear to have heart to embark upon any fresh departure. Then three years later—namely, in 1894—a movement was made in a somewhat different direction, a joint committee being appointed, comprising representatives of the Oxford Delegacies for the extension of teaching outside of the walls of the University, and also representatives of the Royal Agricultural Society of England, and the Royal Horticultural Society, and representatives of the University College of Reading. That joint committee still exists; it has for its chairman the Dean of Christ Church, and its duties or functions comprise the examination of candidates for diplomas in agriculture and horticulture, and the granting of such diplomas. That brings us down to the year 1894. Then in 1898, when Professor Warrington was the incumbent of the Sibthorpean Chair, a proposal came before Congregation, having for its object the establishment of a so-called Honours School in agricultural science. The matter was debated in Congregation on May 17th, 1898, and met with considerable opposition. The opposition took mainly four forms: firstly, that this proposal was in response to a demand from without and not from within the University; secondly, that the University did not provide all the teaching that was necessary for the school, and that candidates would have to resort to some outside institution—namely Reading in this case—in order to obtain the necessary technical instructions; then, thirdly, objection was made to the effect that certain members of the Board of Studies in charge of the examinations need not be members of the University of Oxford. That appeared to be a departure from precedent, and did not commend itself to many members of Congregation. The fourth objection was that the degree obtained by successful candidates in this proposed honours school of agriculture would be in the nature of a technical degree, and many of the members of Congregation looked with disfavour upon anything in the nature of a technical degree. The objectors prevailed, and the grace was rejected by 47 votes to 45, a majority, namely, of two against it. Nothing further

Dr. W.
Somerville.
—
16 July, 1907
—

was done until 1905, when Oxford was charged with the education of the selected probationers for the Indian Forest Service who had been transferred to Oxford at the time the Royal Engineering College at Cooper's Hill was closed. The University of Oxford, in order to provide for the instruction of these probationers, agreed to re-constitute the Sibthorpe Professorship. The College of St. John's came forward and augmented the stipend of the professor by £600 a year, and subsequently associated the professorship with a fellowship in that college, and they promised to undertake the erection of a laboratory with the necessary class-room accommodation. That laboratory was started in the autumn of 1906, and at the present moment the first instalment is practically completed at a cost of £3,000. The college, although not obliged to do more, has, I believe, the intention of finishing this laboratory and class-room accommodation at a total cost of probably about £10,000. The duties of the Sibthorpe Professor, as amended by Statute in 1905, are defined to be the giving of lectures and instruction on the scientific principles of agriculture and forestry (so that agriculture is placed before forestry in the Statute), including the pathology of plants. Last year I took up the duties of this chair under the new Statute, and so far my work has been confined to giving instruction in the pathology of plants and in what is commonly called forest botany. In the spring of this year, after ascertaining to the best of my ability what the feeling of the University was as regards rural education in general, I sent a letter to the Vice-Chancellor, which he brought before the Hebdomadal Council, and as a result the Hebdomadal Council appointed a special agricultural committee, comprising, amongst others, the Vice-Chancellor, the Proctors and the Dean of Christ Church, who is the chairman of the joint agricultural committee for the examination of candidates, and for the granting of diplomas. The agricultural committee that was so appointed by the Hebdomadal Council recommended that the subject of rural economy should be included amongst the subjects for a pass degree, and that a diploma should also be granted in this particular subject. That was a unanimous recommendation by the agricultural committee. The Hebdomadal Council received this recommendation and considered it, and unanimously adopted it, and the agricultural committee are now charged with the duty of drafting Statutes and regulations to give effect to this suggestion that a degree and diploma in agriculture should be granted. In due course the Statutes and regulations will come before Convocation, and if they are accepted, then the degree and the diploma will be formally established. In this case we are not asking for an Honours School in agriculture, because we believe that those who want to study agricultural science in the most thoroughgoing fashion can best approach it through one of the existing Honours Schools in natural science. There are at present Honours Schools in chemistry, botany, physiology, geology and zoology, and we think that a man who has gone through one of those purely science schools has probably laid for himself the best foundation for the advanced study of agriculture. Besides the examinations for responses and moderations that all candidates for a pass degree must take, we suggest that this special or final examination for the pass degree in agricultural science would comprise a modern language, either French or German, and secondly some science subject, such as biology, or zoology, or chemistry or geology. It would comprise first of all this language, and secondly a science subject or a historical subject, so as to open the degree to those who had a disposition to study the historical developments of agriculture; or a legal subject, such as the law of contracts, or some economic subject; and, thirdly, the candidate would take what we call agricultural science, the scope of which has not yet been quite defined. That would be the course he would pursue; he must take a language, and he would require to take agricultural science, and for a third subject he could take a science subject, a historical subject, a legal subject, or an economic subject. Then as regards the diploma, the examination for that would be much more technical, and the course of study would extend over two years; but a candidate who was already a graduate of the University would probably be allowed to sit for and to secure his diploma at the end of a single year of specialised study. The subjects for the diploma would be the elements of general science, geology, chemistry, biology and the application of these sciences to agriculture, and also a certain amount of instruction in forestry up to the requirements of the English land owner or future English land agent. In approaching this subject, and in making these suggestions, the Hebdomadal Council, or rather this agricultural committee of the Hebdomadal Council, has been very careful, of course, to keep the fact in view that already in the neighbourhood there is a fully-

equipped agricultural department in the University College of Reading. The agricultural department of the University College of Reading, I believe, was partly designed to meet the requirements of the Oxford undergraduate. It was expected that the Oxford man, after taking two years or so in the University, would repair to Reading in order to go through special instruction in agriculture, but that hope has in no sense been fulfilled. There are serious difficulties, as anyone who knows Oxford must be aware of, in an undergraduate going to any other place of instruction than the University, and in point of fact after 12 years' experience of the agricultural department of the College of Reading, it has been found that not a single Oxford student has actually gone to Reading and has taken the diploma or certificate there. The Reading authorities, I believe, recognise that the agricultural department at Reading has practically no influence upon Oxford life, and I think we have it in evidence here from Professor Percival, the head of the agricultural department at Reading, that they there view with the utmost favour developments in the direction which I have indicated within the University of Oxford. This agricultural committee, as I have already pointed out, contains amongst others the Dean of Christ Church, and the Dean of Christ Church is the chairman of this joint committee, and he is entirely in favour of developments within the University of Oxford, and as he is the link between the University and Reading, it may be assumed that he anticipates no sort of injury to the department at Reading. If these developments that I have outlined should take place, naturally enough the University will require funds. The internal income of the department of rural economy at Oxford at the present time is practically £1,000 a year, but if we are going to undertake specialised instruction in agriculture and rural economy generally, we shall, of course, require to set up the necessary staff to do so, and I suppose that the expenses of the department will be something like the expenses at other analogous institutions, such as the University of Cambridge, or the University of Leeds, or the College at Wye; that is to say, we should probably be able to undertake this work if we had an income in addition to that which we already possess of something like £1,000 a year. I may say finally that if this department were started in Oxford it would not have anything to do with local agricultural instruction either in the county of Oxford or in any of the adjoining counties. That ground is already covered by the agricultural department in Reading, and I believe is covered with very great satisfaction to everyone concerned, so that the University would not in any sense propose to trespass upon this province of the University College at Reading; but it would, I trust, be of some service to agriculturists in the surrounding districts, in so far that the resources of the University, through its ample laboratories and scientific departments, would be prepared to undertake special investigations into agricultural problems and questions that might be concerning the agriculturists of Oxford and England generally. I think, my lord, those are briefly the outlines of the scheme that we have in view, and this is shortly a statement of the present position of affairs at Oxford.

15043. I do not quite understand about the diploma students. Do you anticipate that the ordinary undergraduates will become candidates for the diploma?—A certain proportion of them, we should hope.

15044. But do you anticipate that the ordinary undergraduates will become candidates, in addition to others who would be outside students?—When I say a certain proportion of undergraduates I mean that the diploma would be available generally for those who are members of the University of Oxford.

15045. A man to get the diploma would have to be a matriculated student, would he?—That is what we believe to be desirable. Of course, the regulations are not yet absolutely framed, but that is what we think is desirable. A man may become a member of the University of Oxford in various ways, of course, and amongst others he may be only a non-collegiate student, and there does not appear to be any hardship in demanding that a candidate for the diploma should, in fact, be a member of the University.

15046. You have not told us whether you propose to undertake much research work?—Yes, we should hope to do a good deal of research work.

15047. The department would be very largely for research as well as for teaching?—Yes, we must endeavour to carry on a great deal of research.

15048. Your object would be really to train highly scientific men to a great extent more than practical men?—I think we would be able to give the sort of education

15042 f

15042 g

Dr. W.
Somerville.
—
16 July, 1907.
—

that would exactly suit the requirements of the prospective English landlord, or of the sons of large tenant farmers, and also young fellows that were intending to be English land agents.

15049. Would the training be something analogous to the training in the law school at Oxford for future lawyers, because that, so far as my knowledge of it goes, is more an educational training than a training of any actual practical usefulness?—I believe that the future lawyer requires to serve his articles subsequently with a solicitor, or with counsel, as the case may be.

15050. What I mean is this, that the undergraduate who goes through the law school at Oxford would hardly consider himself competent to begin practising law as soon as he left the University?—As a matter of fact, he would not be allowed to.

15051. I mean even if he were allowed, he would not be qualified to do so, and I wanted to know whether the agricultural student who passed his degree would be somewhat in the same position?—Of course he would not be qualified practically. I hold very strong views indeed upon that point. I may say that the committee of the University that was appointed in the early nineties laid it down very clearly that the University could do nothing to train a man in the practical details of agriculture. They said: "It is obvious that every-day manual operations of husbandry, the knowledge of which can only be acquired upon the land itself, are not subjects of University teaching. It is equally obvious that the qualifications on which the successful prosecution of agriculture as a branch of commerce mainly depends—namely, practical experience, quickness of observation, knowledge of markets and prices—must be given elsewhere than at the University." And with that contention I entirely agree.

15052. Would you suggest that your legal subjects should include a practical acquaintance with the Agricultural Holdings Acts, for instance?—I should say certainly that a man who goes through the course in Oxford ought to be made thoroughly acquainted not only with the Agricultural Holdings Acts, but with all Acts and Regulations which concern the management of English land, with all the regulations, for instance, that are issued by the Board of Agriculture in connection with the Animals Diseases, the Fertilisers and Feeding Stuffs Acts and such subjects, and also the Regulations issued by the Local Government Board, which, of course, regulate the sale of milk and dairy produce.

15053. I do not quite understand the proposed history subject. Is that to study the past movements in land and agriculture, say, in the middle ages?—I may not have made it quite clear that history is an alternative subject.

15054-5. Quite so; but supposing a man did take that alternative, what would be the heads of the instruction?—I should say the history of land tenure and the development of agricultural tenure generally throughout the country.

15056. (*By Lord Belper.*) I think, as a matter of fact, the idea with regard to Oxford students, that those who intended to go in for agriculture should go to Reading for their agricultural education, entirely failed?—Yes, it absolutely failed; none have gone at all.

15057. What was the idea? When were they to go, in the course of the term or during the vacation?—I think the idea was that a man should go to Reading for his third year.

15058. And leave Oxford?—Yes, and leave Oxford entirely for the time being.

15059. And reside at Reading?—And reside at Reading.

15060. With regard to your suggested scheme now, you said a student must be a member of the University, that that was the idea, but that he need not be a collegiate student. What would his being a member of the University entail in the way of expenses?—I fancy that a member of the University may complete an academic year on as little as £120. I think £120 is generally taken to be about the minimum; but £150 is probably nearer the average.

15061. That includes his residence and keep, I suppose?—Yes, that would include maintenance and fees.

15062. Fees?—Yes, it would include everything.

15063. £120?—Yes, the fees would probably be about £16 a year.

15064. Do you mean the cost would be £120 irrespective of his residence and keep?—No, it would include everything.

15065. Not the collegiate students?—Yes, even collegiate students.

15066. I do not quite understand. Is there any definite arrangement made by either University for these extra non-collegiate students?—The non-collegiate students are a definite body of men who are not members of any college, but who are supervised by a censor.

15067. And who are members of the University?—Who are members of the University.

15068. That £120 would about represent the cost, including the fees, to a non-collegiate student?—Yes.

15069. (*By Lord Moreton.*) The Joint Reading and Oxford Board, to which you referred just now, in charge of the present diploma only works as regards Reading College, does it not?—That is so.

15070. What provision do you expect to have when the scheme which is being put in force is completed for practical demonstration?—I cannot say what will be the ultimate machinery. The College of St. John's have a great many farms in the immediate neighbourhood of Oxford, and that college has already indicated its willingness to hand over one of these farms to the department; but at this stage we have not gone very much into the subject; we have not discussed conditions or anything of that sort. My feeling at the present moment is rather in favour of having a first-class farm within three or four miles of the University, which would be run upon purely practical lines, which would not be encumbered by expensive equipment concerned with research, but which would endeavour to illustrate and demonstrate the very best principles of agriculture as applied in ordinary practice, and it would give an opportunity, of course, of showing young agriculturists how farm-books can be kept in a simple and yet thoroughly efficient manner, and would give them ample opportunity of becoming also acquainted with the ordinary practice of English agriculture in its best form. Probably in addition to that we should want, I think, some small area of land where we could do research work, the expenses of which, however, would be kept entirely distinct from the expenditure upon this practical farm that I have in my mind.

15071. Do the buildings now planned include ample accommodation for research work?—Yes.

15072. (*By Mr. Acland.*) Have you formed any opinion on the question of an alternative between the present system of the management of their estates by the separate colleges and the possibility of the management of all college property by a central body, such as the Ecclesiastical Commission, or on similar lines to the Ecclesiastical Commission, as affecting the possible relevance of your work?—I have not considered that large subject, I must say.

15073. Do you think that you are likely to be able to get what you want in connection with demonstration through colleges at present?—I should think so. The colleges, of course, own very considerable estates, and I should not think that any college would have any objection to making its books and accounts available for use in the agricultural department, and, as I say, one of the colleges would probably be willing to hand over a farm. I do not know that they would hand it over rent free, and in any case I do not think it would be desirable that the department should run a practical farm without charging itself with a substantial rent. It would defeat the object in view if, in fact, the department did not meet the ordinary expenses of a tenant-farmer, and there are, of course, as you can see, difficulties in the way of obtaining the capital for equipment. A 500 acre farm, thoroughly equipped and up to date, would require an expenditure, I suppose, little short of £5,000 of capital. We have not yet, as I say, gone into the details of the scheme, but I daresay these difficulties will be overcome when the proper time arrives.

15074. (*By Lord Belper.*) To follow up what I asked before, is your idea that this agricultural course would be taken up chiefly by those who are students—those who would go naturally to the University—or that it would attract others who had never been there before?—I should think that the bulk of the students would come from exactly the class that are at the University now. It would be very interesting indeed to get out statistics showing the percentage of students whose whole future will be concerned with the management, in some shape or form, of English land. What the number is at present I cannot say, but it must be a very large one. These men at the present time either go down without a degree or they take up a subject that is only indirectly connected with their future work. History, I believe, is a common

Dr. W.
Somerville.
—
16 July, 1907.
—

subject; but, at any rate, they very seldom indeed take science, and of course they never take agricultural science, for they have not had the opportunity; but when the opportunity is provided I should hope that a very considerable number of these men will be induced to study a subject that clearly has a closer bearing than any other upon their future work. The Dean of Christ Church says that he has men coming to him constantly and still more frequently, I believe, the parents coming to him, and deploring the fact that there is no specialised instruction in the direction that we are now considering.

15075. I quite understand your answer; but besides that do you expect that there would be any of the highest class of farmers who would send their sons to Oxford to get a degree in agriculture where they could get at the same time a good sound education?—I should think a very considerable number of the sons of tenant-farmers come to the University of Oxford now. I know they did at Cambridge. Professor Middleton will no doubt tell us specifically that a very considerable number did go to Cambridge, and no doubt they do go to Oxford.

15076. Successful farmers, who can afford to pay for their sons at a university?—Yes.

15077. This agricultural course would really be an advantage to Oxford in both ways, would it not, by reason of attracting some new students and giving a satisfactory course required by a considerable number of those at the University to take up a degree in agriculture?—That is our view.

15078. (By Mr. Staveley-Hill.) At the present moment you have not got any farm, I suppose?—No.

15079. There is no practical work done now?—No, there is neither theoretical nor practical work done in agriculture at present.

15080. It is a college with which I happen to be very familiar, St. John's College, which has provided the Chair of Agriculture?—Yes.

15081. That college has perhaps more facilities than any other, as they have large farms in the neighbourhood of Oxford?—That is so.

15082. What should you say as to the size of farm that you would require?—I think we would like a farm of about 500 acres.

15083. It is not suggested, is it, in the event of further development, that moderations and responsions should be altered. They would be a necessary part of the education in the first instance, would not they, before a student took up the agricultural education?—Yes. Of course Oxford, like Cambridge, contains a great many people who think that examinations should be altered, and no doubt an attempt will be made in the future, as an attempt has been made in the past, to bring them more into line with modern requirements; but for agricultural students we do not want to claim any special privileges or exemptions. We should all like to see moderations and responsions, or their equivalents, in Oxford and Cambridge modified, but we would not claim any privileges for agricultural students alone, and our view is that they should take their place in the educational machine, and should go through the same general sort of mill, other things being equal, as the ordinary students do.

15084. (By Professor Middleton.) Do you intend your diploma examination to consist of two parts?—Yes.

15085. Is the examination for a B.A. degree to correspond with the examination for Part I of your diploma?—No; it is different from yours in that respect.

15086. Will you require all students to pass Part I? Is that your intention, or will you excuse those who have taken an honours degree?—That is a detail that has not been considered, but I should be entirely in favour of exempting a man from, we will say, the chemistry of Part I, if he had already passed an examination in chemistry in an honours school. I am entirely in favour of exemptions; I do not believe in multiplying examinations unnecessarily, and I have no doubt that that would occur, because in the diploma in forestry, which has now been established for a couple of years, men who have passed in botany and geology in an honours school, and who have taken at least a third-class, are exempted from those subjects in the forestry diploma.

15087. (By Mr. Medd.) In drawing up the list of subjects for foreign languages have you considered Russian and Spanish as being especially applicable to agriculture?—The University regulations on this subject are that for a pass degree a man must take a modern or an ancient language. The ancient language must be Latin or Greek;

the modern language must be French or German, or for certain natives of India it may be an oriental language; but I do not think that either Russian or Spanish is an alternative.

15088. You might agree with me that Spanish is probably the most valuable modern language for an agriculturist to know?—I do not know whether I should agree with you in that.

15089. The amount of trade which the farming classes have with South America is probably greater than with any other part of the world, and our English people are constantly in difficulty in finding capable agriculturists who are familiar with Spanish, and the same with regard to Russian. I was only suggesting the possibility of you considering that point when drafting your Statutes, the placing of Spanish or Russian as alternatives?—I am sorry I cannot give you all the details of the Statutes at the moment, but clearly, of course, this matter that you raise would apply all round; that is to say, not to agricultural students alone.

15090. I do not know that it need apply generally. May not the fact that none of your Oxford pupils have hitherto gone to Reading be attributed to this, that Oxford has no prepared any training for them. The conditions will be wholly different in future?—Yes; but if we provided agricultural training at Oxford, it seems to me that that would be an additional reason for their not going to Reading. In the past, with no agricultural training at Oxford, there has been an inducement for them to go to Reading, where agricultural training is provided, but they have not gone.

15091. Quite so; but I mean in the high agricultural training in science and which your scheme suggests. Having had facilities for that at Oxford, they would go for the more practical work to Reading, or might go?—Yes, I think they might very well go to Reading for special work for instance, in dairying, which Oxford would not provide.

15092. No importance can be attached to the fact that they have not gone in the past, because they have not been encouraged to take up the subject at Oxford at all?—No, they might go for specialised instruction in dairying or horticulture—in which Reading is very strong—and poultry.

15093. Am I correct in estimating the total cost you suggest as £2,000?—£2,000 would appear to be about minimum to start with.

15094. The University already provides £1,000?—Yes.

15095. In regard to diplomas and residence, the Vice-Chancellor, as you will remember, I think, in giving evidence here said there were certain regulations on conditions with respect to different types of students: the did not all have to reside three years?—No; if they come from an affiliated institution that saves them one year and that would apply equally in this case.

15096. Have you considered at all what area might most usefully be affiliated to you first in regard to counties, and secondly in regard to institutions?—Of course, at present the University only recognises institutions. If men have gone through, I think it is, two or three years' training at an affiliated institution, that period at the institution saves him one year when he comes to Oxford; but there has been no question of allowing a man to forego any part of his training in Oxford in consideration of his coming from any particular area.

15097. Then I take it you would have no difficulty in affiliating Cirencester to you?—I think we might have very great difficulty indeed in affiliating Cirencester to us. I am not prepared to say that it would be impossible, but I am prepared to say that it would probably be difficult. You would like, I suppose, to see a student from Cirencester coming to Oxford and being in a position to take his diploma with less than the normal time of residence?

15098. With two years. It would be upon the same terms exactly as Reading, and would not you desire ultimately to have such counties as Hereford, Gloucester, Wiltshire and Somerset affiliated to you and comprised within a group?—No, we do not want any affiliation of that kind. You see the ground is already taken up by Reading. Reading already has Oxford and Buckingham and Berkshire affiliated to it.

15099. Yes, it has those counties, but the counties I am referring to are excluded from affiliation?—I do not think so. I think the University of Oxford regards itself as an Imperial institution, and would not view with favour the suggestion that it should be for certain purposes regarded as a local institution. That is my view, but there is no reason, of course, why a man should not come from Hereford or any other county.

Dr. W.
Somerville.
—
16 July, 1907.
—

15100. Yes, but the University of Cambridge accepts some responsibility in that respect?—The University of Cambridge, of course, throws its diploma open to a man from any part of the world, without any qualification of residence, and although one would think that that would attract candidates, I fancy that we shall have evidence put before us that in point of fact very few men come from the outside for these diplomas at Cambridge.

15101. (*By Lord Barnard.*) You have practically answered one question that I was going to put to you, that Oxford would probably not favour any suggestions which would involve it becoming a local institution. It considers itself practically a national, and even an Imperial, institution?—Yes.

15102. Therefore any question of affiliation with subordinate institutions would not be exclusively based on local grounds. Is there any reason why an institution in the north or the west of England, or in the south-east, should not be affiliated with it?—No, none at all. I do not know what the affiliated institutions are, although Reading happens to be affiliated. I know there are others out of the country altogether that are affiliated.

15103. As to the Cooper's Hill College, or rather what was formerly Cooper's Hill, how many students are there now at Oxford who take the Indian forestry course?—I can tell you exactly: 27 in their first year and 15 in their second.

15104. Are they matriculated students of the University?—Without exception they are.

15105. With regard to college estates, they are situated all over England, are they not?—They are.

15106. So that nothing short of a great Parliamentary movement for altering the system of administration would really affect your department?—I fancy not.

15107. I dare say most of us know that in former years they were managed on a system of letting on fines?—Yes.

15108. That has altogether ceased now?—Entirely.

15109. They are managed now on the ordinary system that large privately-owned estates are managed?—That is the attempt.

15110. You used the words, I think, that you have reason to believe that there are numbers of undergraduates at Oxford who are likely to be in some way or other connected with the management of land. Could you give us any grounds for that belief? Why I ask is because I should have thought it would have been the reverse?—The grounds for my belief are that those at present who possess English estates have to a large extent I think gone through one or other of the old Universities.

15111. Do not the eldest sons of the English country gentlemen go into the Army nowadays?—You have more experience of English country gentlemen than I have, of course; but I meet with English landowners very frequently who have been through one or other of the Universities.

15112. Naturally you meet with many in every profession who have been through a university. You have

better opportunities of judging than I have, but casting my mind back to my own undergraduate days at Oxford, I was four years at Oxford, and to the best of my recollection a very large proportion of those men either became soldiers, or professional men, or clergymen, or went abroad, and very few of them that I know of were connected with land. I understand the University of Oxford has two distinct objects in view, one is that a man should go through the ordinary university education with an agricultural bias at the end of it, and the other would be strictly speaking not university education at all, but that he would take a diploma for his knowledge of agricultural science?—Yes; but there are diplomas in a considerable number of subjects already. A man may take a diploma in economics, or anthropology, or in geography, and so forth; and the men who take these diplomas as a rule are men who have already taken a general degree, if one may call it so, and who have gone through an additional year of residence for the purpose of specialised study, and the men who would take the agricultural diploma, I should hope, would be men who had already taken a degree without particular reference to any specific subject. A man very often comes to the end of his university course and suddenly realises that his course has led to nothing, that he has qualified for nothing in particular, and realising that, he then resolves to specialise for a year, it may be, as I say, qualifying to be a teacher, or in some other direction, and in the case of men whose tastes lay along the line of agriculture I should hope they would take the agriculture diploma.

15113. (*By Professor Middleton.*) You refer to the fact of a man coming to the end of his course and then finding that he wants to take a diploma in a new subject. Do you not think it very desirable to get hold of the student who is going to take agriculture early in the course, and guide his study?—Certainly. We shall take them as early as we can get them, but a large number of men always will get to the end of their general course before realising that it has led to nothing in particular. The ideal condition of things, undoubtedly, is to catch them young, but many of them escape.

15114. Would you have them utilise the vacations for practical work?—Yes, to some extent; but I think the practical work can better be done by taking a year of definite application in that direction.

15115. Afterwards?—Afterwards. Of course the question has often been before this Committee as to whether a man who is going to be an agricultural scientist should learn his practice before or after his college course. I have not the smallest hesitation in saying that he could make a great deal more of his college training if he had a thorough knowledge of practical agriculture before, but I should not on that account recommend a young agriculturist who is going in for agricultural science to take his practical work before he takes his university course, because in a great many cases such men never come on to scientific study after they once get fairly launched on practice; that is to say, it is not an alternative between taking practical agriculture before or after science; but is very largely an alternative between taking science before agriculture and not taking science at all.

Mr. A. G. L. ROGERS called and examined.

Mr. A. G. L.
Rogers.
—

15116. (*By Lord Barnard.*) You are the Head of the Intelligence Branch of the Board of Agriculture and Fisheries?—Yes; I have been there about three years and a half.

15117. Would you tell us exactly what the Intelligence Branch is?—I think the simplest plan would be, if I may be allowed, to read the extract from the official paper which is described as the Division of Business which gives the official explanation of all the work done by each division, and branch of the Board.

15118. If you please?—“*Intelligence Branch.*—Business and correspondence connected with the following subjects, so far as they relate to the work of the Board—sale of food and drugs, fertilisers and feeding stuffs, margarine and butter substitutes, merchandise marks, weights and measures, agricultural labour and workmen's compensation, cultivation and utilisation of crops, adulteration and testing of seeds, insect and fungus pests, wild birds, railway rates and facilities, agricultural organisation, sale of agricultural produce (except statistical work), agricultural banks and insurance, breeding and management of farm

stock, poisons, agricultural experiments, taxation and rating, fruit cultivation and cider making, hops, agricultural machinery and traffic (including canal traffic), dairying, bee-keeping, poultry-keeping (including diseases of poultry), meteorology. The examination and collection of information from the home, colonial and foreign newspapers, Government reports, and publications of learned and technical societies on matters relating to agriculture and fisheries and the preparation of reports when necessary on them. The preparation and editing of the *Journal of the Board of Agriculture* and the leaflets of the Board. Business connected with the sale of certain of the Board's publications. The issue of certificates required for the exportation of live stock to certain foreign countries. The collection and tabulation of reports of agricultural experiments conducted in Great Britain. The care and management of the Board's Library. The translation of letters and papers in foreign languages for the Board. Correspondence with the honorary agricultural correspondents on matters not dealt with by other branches of the Board. Business (except accounts, technical science and establishment

matters) with the Royal Botanic Gardens, Kew. The preparation of an Annual Report to Parliament on the work of the Intelligence Division."

15119. When was this Branch first established?—The Intelligence Branch was founded, I think, in 1893.

15120. Is it under the Secretary of the Board, or have you an Assistant Secretary?—We have an Assistant Secretary for the Intelligence Division. The Division is divided into the in-door branch and the out-door branch; I am head of the in-door branch.

15121. You have a considerable staff, I suppose?—There are three assistant heads, one staff officer, four second division clerks, and three boys.

15122. How do you manage your translation of foreign documents; are you all qualified to do that yourselves?—I can do about four languages myself, and I expect every one of my assistants to qualify in one or two languages, including the second division clerks. We have one who got his appointment because he was studying Italian, another is studying Spanish, and practically all of them. I think, know more or less German, and of course, French.

15123. Is the work of the branch increasing?—The work has increased very considerably in the last three years.

15124. What relation has your Branch to the Branch which deals with agricultural education?—The Educational Branch of the Board consists at present only of inspectors. There is no in-door staff of the Educational Branch; we do all the in-door work of the Educational Branch. In addition to that, we consider, that the whole of the work of collection and dissemination of information is educational and we regard agriculture more from an educational point of view than from an administrative point of view, in much the same way, if I may give an example, as in the Spanish-speaking countries, the Ministerio di Fomento deals with agriculture, that is to say as a body for encouraging agriculture than as a body for governing it.

15125. You are familiar with the principles, I daresay which are adopted in Ireland?—Yes.

15126. Do you perhaps in a smaller way attempt to give effect to those principles in your department?—As far as we can. We have only two subjects which we deal with otherwise than educationally, that is the Sale of Food and Drugs, and the questions under the Fertilisers, and Feeding Stuffs Acts.

15127. In addition to the inside branch that you have referred to, what is the outside branch which you mentioned?—There is an out-door branch of three inspectors.

15128. What is their duty?—Nearly the whole of their time is taken up in dealing with questions under the Food and Drugs, and the Fertilisers and Feeding Stuffs Acts, and questions of railway rates, and the out-door work corresponding to the indoor-work that the clerical staff do.

15129. Now, with regard to the general public, you have something to say as to your relation with them?—As I have said, the work of the Branch is naturally divided into two classes. There is a good deal of work that we have to do for other branches of the Board, such as translations, and so on. I mention that in order to explain that the whole of the time is not taken up with the general public, but the work we do for the general public may be described as the collection and dissemination of information on all questions relating to agriculture, and of acting as far as possible as the Attorney of Agriculture in dealing with other departments.

15130. You are prepared to give us some information as to the methods you adopt first of all for the collection and dissemination of information?—I have divided this under practically four different heads. There is the collection of information through the honorary agricultural correspondents, through the agricultural colleges, by general correspondence, and through Kew and the other authorities such as the Government Laboratory. Perhaps I might take the last one first as it is the simplest. All questions relating to botanical subjects are referred to Kew; all questions relating to chemical subjects would be referred to the Government Laboratory. We have also a zoological expert to whom we refer questions of entomology, and so forth. Those are outside experts.

15131. Do you submit questions to those different departments?—Yes; we have a very large number of samples of diseased plants, or plants affected with insect pests, sent to us. The ones that are supposed to be the subject of a fungus attack are sent to Kew, and those which appear to be attacked by insect pests are referred to our entomological expert. We have a very large number of those samples.

15132. Now the next head, the correspondents?—*Mr. A. G. L. Rogers.*
The honorary agricultural correspondents are situated all over the country. Their number is somewhere about 330, and they, so to speak, act as informal representatives of the Board in their districts. Their chief use is for supplying the Board with local information whenever such information on any particular subject is wanted.

16 July, 1907.

15133. Do most of them take an active interest in the office, do you think?—Would you mind defining a little more clearly what is meant by "active interest"?

15134. Do they supply you with a great deal of information?—The chief work of the correspondents is to send us information when asked for; very few send unless they are asked.

15135. Do you find that the information that they send to you is useful?—We have had a great deal of useful information from the agricultural correspondents.

15136. (*By Lord Belper.*) Those agricultural correspondents were appointed a few years ago for the first time, were they not?—Yes. The idea was Mr. Hanbury's, but it was not carried into execution until after his death.

15137. (*By Lord Barnard.*) I suppose they vary; some are more busy than others?—Some are more busy than others.

15138. Have you ever contemplated the possibility of using them for the dissemination of information?—Yes, but I do not think it would be a good idea.

15139. Could you tell us why not?—In the first place you must remember that these gentlemen are none of them paid, and therefore the Board would have no control over them; the work is entirely honorary.

15140. (*By Lord Belper.*) They get some expenses or something allowed, do they not?—No, no expenses.

15141. (*By Lord Barnard.*) I suppose they would get travelling expenses where such expenses were incurred?—Yes, they would get travelling expenses if we asked them to travel for us; but we never have as yet.

15142. (*By Lord Belper.*) I suppose one of their duties is rather to mix with the people about, and to go to markets, and so on?—In the course of their ordinary business.

15143. But they get no expenses paid?—They get no expenses paid.

15144. (*By Mr. Latham.*) As a correspondent myself, I think it is only fair to say there is no remuneration for our services, and all our letters are sent to the Board free?—That is so.

15145. (*By Lord Belper.*) They get no remuneration in any shape or way?—No.

15146. (*By Mr. Latham.*) We get all our stationery free?—You get all your stationery free, and the publications of the Board.

15147. (*By Lord Moreton.*) Cannot anyone get all the publications free?—Not all the publications.

15148. (*By Mr. Latham.*) We get almost a library of information through being an agricultural correspondent which I for one value very highly; and a great many people who know I am a correspondent come to me and ask me if I can lend these things to them.—Yes.

15149. (*By Lord Barnard.*) Is there anything more you would like to add on the subject of honorary correspondents?—I should like to give you one instance of where we have received very valuable information from them. Some time ago we had information of the existence of a rather bad outbreak of the diamond back moth in Norfolk, and we wrote round to all our correspondents in Norfolk, and asked them for information as to how serious the attack was. Fortunately, it proved not to be so serious as was at first supposed.

15150. (*By Lord Moreton.*) Did you get valuable assistance in that matter from your local correspondents?—I think, on the whole, the assistance was valuable.

15151. (*By Lord Barnard.*) That was merely an instance of the use you make of the correspondents?—Merely one instance; there are a very large number of instances quoted in our Annual Report.

15152. Now to come to the agricultural colleges?—With regard to the information collected from the agricultural colleges I should like to point out that, in the first instance, practically all the most valuable articles which appear in our *Journal* have been supplied by the different members of the staff of the agricultural colleges.

15153. Are they paid for that?—Yes, they are paid as

Mr. A. G. L.
Rogers.
16 July, 1907.

contributors to the *Journal*; and, secondly, that whenever we want to get any special information about the conditions of agriculture in any part of England, we generally find that the agricultural college is the place where we can get the best information of a scientific nature. In connection with that I might state, perhaps, that the want of an agricultural college in the south-west part of England very much affects us, inasmuch as we find it difficult to get information from that part of the country, whereas from places like Yorkshire, or Kent, or Cambridge, or Wales, as we are in close touch with the agricultural colleges there, the information is much better and much more accurate.

15154. Do the agricultural colleges supply all their publications to you?—Yes.

15155. What use do you make of them, or do you make any use of them?—They are all filed very carefully in the library, and, as I daresay you know, the library of the Board of Agriculture is open to the general public, not only for reading in the office, but also as a lending library.

15156. I do not think that is generally known?—It is mentioned every month in the *Journal*, in a footnote.

15157. With regard to these leaflets and publications issued by the colleges, are they read and annotated, or made any use of beyond their being filed and put away?—The reports on the experiments are all epitomised and put into the *Journal*. The leaflets, of course, will not be because there is nothing generally very special in them; they are merely meant for local circulation; but we have recently, I think, put epitomes of every single one of the reports on experiments in the *Journal*. In addition to that, we are preparing a sort of index and tabulation of these reports, which I hope eventually will be very useful.

15158. Have you anything more to say on the subject of agricultural colleges?—I should like to say one thing, if I may. The same remark applies with regard to Scotland as to the south-west of England. The Board do not give any grants to the agricultural colleges in Scotland, and therefore, although we are on the very best of terms with all the members of the staff of the Scotch agricultural colleges, we are not in the same position with regard to them as we are with regard to the English colleges. The orientation, so to speak, of the Scotch colleges is towards the Scottish Office, and the orientation of the English agricultural colleges is naturally towards us.

15159. Cannot you get information in Scotland through the intervention of the Scottish Office?—Yes, and you can get it direct by writing to the agricultural colleges; but it is not the same thing quite as it is with English colleges.

15160. How do you suggest it could be improved?—I am not making any suggestions.

15161. You could not attempt to deprive the Scottish Office of any part of the Scottish administrative work?—I have not suggested it.

15162. And you would not attempt it. Therefore this difficulty of getting information must remain, except by voluntary means?—Yes.

15163. Then as to the last point, namely, general correspondence?—We have a very large number of letters every day, varying from about 30 or 40 to sometimes 500 or 600 persons who write up to us asking for leaflets. I make a point of going through all those myself in order to see whether there is any special information with regard to the prevalence of insect pests or any other kinds of pests to be gathered from those letters in order that we may make further enquiries in the country. It was through that that I first heard about the spread of black scab in potatoes from Cheshire, over the North of Wales up into Lancashire and down as far as Staffordshire.

15164. That enabled you to take action?—Yes; it is a very serious potato disease.

15165. Is that all you have to say about general correspondence?—Yes.

15166. Now will you go to the methods of dissemination. The first is the *Journal*?—Yes, in the first place, there is the *Journal* which is published monthly, and which is sent free to our agricultural correspondents, to practically every agricultural society in Great Britain, and of course to the colleges, and a large number of free libraries and other agricultural institutions. In addition to that we have a very considerable number of subscribers, so that we have a very valuable means of disseminating information about agriculture, and as to the work and views of the Board through the *Journal*.

15167. When you say it is published, is it published in the ordinary sense of the term by an outside publisher, and is it on sale to the public, and if so, where?—In the first instance the *Journal* was published by the Stationery Office, subsequently it was farmed out to a firm of publishers, and last March the publication was taken over by the Board, so that we now do the whole of the work ourselves. We sell the *Journal* ourselves.

15168. It does not pass through any trade channels?—We sell a certain number through booksellers and railway book stalls, but the greater part is done by direct subscription.

15169. Do you think it reaches a sufficient number of hands?—It is very difficult to say how many readers there are. I know very well the number of persons who subscribe, but as a considerable number of copies are sent to agricultural societies, and, as Mr. Latham said, to the agricultural correspondents, and a good many persons come and borrow copies of the *Journal*, I am perfectly certain it is read a great deal more than it is subscribed to.

15170. This *Journal* really is a source of considerable expense to the State?—Up to a year ago the publishers paid the Stationery office £100 a year for the privilege of publishing the *Journal*.

15171. Do you have any idea as to whether the sale of it, say on railway bookstalls, is increasing?—During the last two years the sales by bookstalls and through agents, booksellers, and so forth, slightly increased, and the number of subscribers went down. That was due to the fact that the *Journal* being a monthly publication could not be registered as a newspaper, and consequently the postage on a 4s. publication was 2s. a year, that is 50 per cent. We have made an arrangement this year by which as the Board publish the *Journal* we send it out post free. The subscription now is only 4s., and the number of subscribers is increasing in consequence.

15172. Do you ever have any evidence as to its being much appreciated?—We have a very large number of letters at one time and another, more especially recently, saying how useful it is.

15173. Letters intended for publication in the *Journal*?—No, letters sent to us.

15174. Commenting on information that has been given?—Yes, we get letters commenting on information nearly every month.

15175. Is that all you have to say about the *Journal*?—Yes.

15176. Is it your idea that this publication reaches the hands of all those who are likely to be interested in it?—No, not yet. Perhaps I may give one example of the use to which we have put it. Some time ago we had complaints from people who wanted to send pedigree cattle to foreign countries, but did not know what the importation regulations in those foreign countries were—so we sent round to practically every civilised country and got copies of their official regulations dealing with the importation of cattle. Those were epitomised and they have all been published in the *Journal*. We are now doing the same with regulations dealing with the importation of plants.

15177. I think most foreign countries and British Colonies do publish and issue an official publication of this kind?—Yes.

15178. Other Government departments issue these official publications?—Yes.

15179. Do you know what the origin of the *Journal* was at all? Was it that the Board of Trade first established an official *Journal*?—Yes, I think that is so.

15180. (*By Lord Belper.*) Do you know how long the *Journal* has been running now?—13 years. It was a quarterly publication until three years ago, and now it is a monthly.

15181. (*By Lord Barnard.*) Now, to come to the next method, leaflets. We are more or less familiar with them. Is there anything special you wish to say with regard to them?—The leaflets are, to a large extent, the articles which have been published in the *Journal* reprinted.

15182. I have in my hands a criticism from a gentleman who is well able to judge of these things, that he has forwarded to the secretary of this Committee in which he animadverts rather severely on these leaflets. He says that he considers the language used is not sufficiently simple in many cases, and that there are, as he describes it, to use his own words, "padding and platitudes." I suppose, as a matter of fact, they are prepared by gentlemen

who have practical knowledge, as a rule?—Yes, in every case.

15183. At the request of the Board?—Yes.

15184. Are they edited or published as they stand?—They are, in nearly every case, first of all published in the *Journal*. We then look at the newspaper criticisms to see whether any suggestions have been made by the critics. Our poultry articles are usually dealt with very faithfully in *The Field* and we always read their criticism with some interest. We then have the article set up as a leaflet, and in that form it is very carefully criticised, first of all in the office, and then sent round to two or three experts in different parts of the country for their observations and criticisms. These criticisms are again considered, and so, before the leaflet is published, it has generally been criticised by three or four experts on the subject.

15185. Do you not agree with this gentleman who thinks that there is too much "padding and platitude"?—That is a statement that has been very often made, and I do not think it is quite fair because people, I am afraid, do not fully understand the nature of the leaflets. Some of these leaflets, of course, are written for quite uneducated persons. For instance, the one on the construction of pigsties was written avowedly in the very simplest language possible. No long words were used, and the description how to put down the concrete floor of the pigsty was given very carefully, and as if one were talking to an agricultural labourer. On the other hand we have a leaflet on the Relation of Woods to Water Supply, which is naturally not written in the same style as it is obviously not intended to be put into the hands of agricultural labourers. Between these two extremes we have all kinds of variations, and I think that a great many of the critics who criticise the leaflets sometimes for being too simple and namby-pamby and sometimes for containing too many long words which no labourer can understand do not quite appreciate that the leaflets are not always meant to be put into the hands of the same persons.

15186. He also complains of the illustrations?—The history of that is that first of all the illustrations were all line drawings, and then it was possible to get a very good illustration on very common paper. Subsequently, when we took process blocks for the illustrations it was impossible to get a clear illustration on the common paper, and we took art paper. Then objection was made that we were spending too much money on the free distribution of leaflets, and we had to cut our expenses down. We have now managed to get a better quality of paper, not quite as good as art paper, but still sufficiently good, and I hope we shall be able to improve the quality of the illustrations considerably. We have taken a lot of trouble to try and improve them, but we have not by any means got as far as we propose to get.

15187. Are the terms on which they are printed much the same as the terms on which the *Journal* is issued, of which you have already told us?—No; we have a special vote from the Treasury—I think this year it is £1,000—for the printing of leaflets; but, of course, that includes the payment for the printing of the bound volume, and the sectional volumes of leaflets which we sell, and where we get the money back again, though not generally in the same year. We printed the sixpenny volume of the first hundred leaflets about two years ago for the first time, and since that I think we have sold about 10,000 copies.

15188. Ten thousand copies of this one volume?—Yes. We have quite a steady sale for that sixpenny volume; it goes on steadily every day. In addition to that we have published the first 148 leaflets in sectional volumes. Those are sold at a penny each volume. In the last two years we have sold about 80,000, that is to say, very nearly 10,000 of each of the eight sectional volumes.

15189. There is one more suggestion which is very familiar to persons more interested in literature than I am, and that is as to whether the authors' names should not be subscribed at the foot of the leaflets?—I do not quite know who would be considered the author of a leaflet which had been revised by about four people. I think very often the original writer might not necessarily agree with the alterations.

15190. It is a compilation, the result of the combined knowledge of a good many brains?—Yes. The articles in the *Journal* are always signed when they are not prepared in the office.

15191. This writer seems to be under the impression that the leaflets are not written by persons who know what they are writing about?—Might I be allowed to read one or two letters that we have received from the opposite point of view?

15192. Yes.—One gentleman writes: "I must mention one instance which shows the value of these leaflets. A friend called to see me some time since. Being engaged at the time, I handed him a few leaflets to occupy him a few moments. On returning to him I found his hair on end as he exclaimed, 'According to this leaflet I have sheep scab in my flock!' He went home, called in the police and 'vet,' and, true, his whole flock was affected. He had noticed that they had been very uncomfortable for some time, but thought it was ticks. Had he seen your leaflet a month earlier he would have been saved a vast amount of labour in clearing his flock." This is another one from an estate office: "I shall be much obliged if you will kindly let me have 50 copies of your leaflet, No. 181, 'Cleansing of Water-courses.' The information is just what is wanted and will do a great deal of good in this neighbourhood. I intend distributing the leaflets amongst the tenants of this estate and their neighbours." This is another one from a Sanitary Inspector, writing from a Town Hall: "About a year and a half ago you were good enough to send a large number of copies of Leaflet No. 151 for distribution among farmers supplying this town with milk, both within and without the district. I take this opportunity of informing you that since the distribution the standard of cleanliness has in many cases been improved."

15193. In spite of what you say, I think it is a fact sometimes that it is not sufficiently well known that these are really the production of the Board, and not of some faddist who wishes to take the opportunity of airing his own views. Do you agree with me?—I should have thought from the newspaper criticisms that the sin is imputed directly to the officers of the Board.

15194. You think the criticisms are written by editors or managers probably?—Yes.

15195. We do not place much reliance on those, if they do not come from the men who are interested practically. Have you anything further to say on the subject of leaflets?—No, I do not think so.

15196. Now as to the Annual Report; that is a Parliamentary Paper, I presume?—It is.

15197. I suppose you are aware that with the enormous quantity of literature that is showered upon members of the House of Lords and of the House of Commons that it is an absolute impossibility to read them all?—Yes.

15198. Do you take any steps to bring your Report specially to the notice of those who would be most interested? Personally, I confess I never see it, not specially I mean?—The Board of Agriculture Report is used as a vehicle very often of explaining the views of the Board on certain subjects. We have a very considerable list—I think it is about 1,000 persons—to whom we send that Report. They are mostly officials, persons connected with the administration of the Food and Drugs Act and the Fertilisers and Feeding Stuffs Act; and in addition to that to a certain number of persons who are interested in the general work of the Board.

15199. Is the Board under any statutory obligation to issue a report of its proceedings, do you know, or is it merely a voluntary act?—I think it is under a statutory obligation to publish it.

15200. Are not publications of this kind very often drawn up by Government departments in order that they may afterwards produce them, and quote from them, and flourish them in the face of the public. I do not wish to speak disrespectfully?—It is a very convenient depository of information.

15201. For the Board?—And for those persons who read the Report.

15202. You also disseminate information by means of the Press?—Yes; the work we have done in that respect is possibly best known in connection with the outbreak of the American gooseberry mildew which was found in England last autumn. The Board published several Press notices relating to it. We brought out, first of all, a memorandum on the subject advising gooseberry growers what they should do, a special memorandum, not a leaflet, in order that it might attract more attention. We sent that round to a large number of newspapers, practically the whole agricultural and local Press. Later on we sent round a second memorandum on the subject. Some time ago, when we heard about the black scab of potatoes in North Wales, we sent a Press notice to all the papers circulating in that part of the country informing them that a leaflet dealing with the subject could be got from the Board. We have done that on various occasions.

Mr. A. G. L.
Rogers.

16 July, 1907.

Mr. A. G. L. 15203. What means do you take to ensure that the notices which you wish to reach the hands of the farmers get into the papers which the farmers read, because I do not suppose it would be much use sending it to *The Times*?—*The Times* puts it all in.

—
16 July, 1907.

15204. No doubt, but small farmers in out of the way places do not read *The Times*?—No, but we send them to all the big London papers, the agricultural papers, to practically every local paper, and to a great many other papers. We send to all the religious papers, and a good many trade papers as well. We get a very large number of applications from persons who say, "I have seen a notice in the *Church Times* that you are issuing a leaflet about gooseberry mildew," or something of that sort.

15205. (By Mr. Latham.) And also to the Chambers of Agriculture?—Yes; and farmers' clubs, and to all the correspondents as well; and I know that these notices are put in all the small papers.

15206. (By Lord Barnard.) You say "Press notices and other methods." What are the other methods?—I put that down to show that we do not rigorously confine ourselves to certain methods, but that we adopt every method that we can think of.

15207. None of these methods, either with regard to the collection or dissemination of information, refer to local authorities at all. Are not you in touch with local authorities?—Yes; we send all our notices to them.

15208. To County Councils?—The clerk of the County Council gets one, and certain of the County Council officials always get them.

15209. Supposing you send a thing to the clerk of a County Council, do you simply put it in an envelope and post it, or do you send him a letter with it and ask him to do anything with it?—It would depend entirely what it is that we send. With regard to certain things we merely send this information, but if we want him to do anything, of course an official letter would be sent explaining to him what we wanted to be done.

15210. To take this Annual Report, for instance, it would be very little use to send this to a clerk of a local authority unless you asked him at the same time to lay it before his Agricultural Committee, if there was one. The clerk would have no time to read it himself, and it would probably be placed on one side?—No; he is their official.

15211. But nobody knows it is there?—The clerk knows it is there.

15212. But he can make no use of it himself. It can only be useful to the clerk for the information of the members of his council, or those who are specially interested?—I think the clerk can make considerable use of it.

15213. (By Mr. Latham.) In the Chamber of Agriculture it is always put on our Agenda that the Annual Report of the Board of Agriculture has been received. I think you ought to tell us that this Report is sent to all the agricultural clubs and farmers' clubs?—I did mention that.

15214. (By Lord Barnard.) My experience of a Government department is that it is quite useless sending them official documents unless you send a covering letter saying "I am directed to enclose" so-and-so for the information of so-and-so, otherwise they are put into pigeon-holes and other places, and are never used. However, that is a matter for the Board?—Yes.

15215. (By Lord Belper.) Are these distributed free of expense?—A certain number are distributed free. Technically those are not the Board's publications, those are the publications of the Stationery Office.

15216. To take the Board of Agriculture's Annual Report to begin with, how many people is that distributed free of charge to, roughly speaking?—About 1,000.

15217. Are they sent to every County Council?—Yes.

15218. One copy?—One copy, and to about 1,000 persons in addition.

15219. With regard to these leaflets, to whom are they distributed?—I do not think we send to the clerks of the County Council in that case.

15220. Not even when there is some prevalent disease existing about which your pamphlets treat?—It would depend, of course, entirely. For instance, if it is a case of anthrax, we should not send one; we should send about 5,000 with a letter requesting him to distribute them. That is how they get distributed.

15221. (By Mr. Medd.) I imagine that is how you have acted with reference to the American mildew pamphlet?—Certainly.

15222. Certainly our Committee have had one?—Yes.

15223. Although I am a member of the Education Committee I have no means of ascertaining what you publish unless I choose to write to London?—Might I say that it would be perfectly easy, because every person who writes up asking for a leaflet gets, in addition to the leaflet, a list of all the publications of the Board, and an application form upon which he can apply for anything that he wants.

15224. I am quite aware of that. I have a collection of your leaflets which were sent to me at the beginning of last year, but since then I have not had a single leaflet from you, and I should have no means of knowing that you had published a single leaflet unless by accident it caught my eye in the newspaper, and small farmers and labourers, who are materially concerned in many of these matters, have no opportunity whatever of knowing of the leaflets?—Have you read the passage in the last two Annual Reports of the Intelligence Division showing what steps have been taken to secure the distribution of the leaflets?

15225. I have not.—It is fully set out there.

15226. (By Lord Belper.) Some of these publications are perfectly new to me to-day, I have never come across them in any way before, and that shows that they cannot be very largely disseminated. Some of them I was quite aware were sent to particular officials. Is the Report of the Board of Agriculture sent to the Director of Education in the counties?—No; the Education Report is sent, not the Intelligence Report.

15227. The Director of Education is in touch with any agricultural education which is being given in the county, and if you want it to be distinctly made use of, it is surely to the Director of Education that it should be sent to and not to the Clerk of the Council?—Perhaps I may be allowed to point out that this Annual Report, although it is called the annual report of the Board, is a publication of the Stationery Office, and if we want copies we have to buy them from the Stationery Office. The Stationery Office put them on sale and they expect people to buy them.

15228. I am only wanting to find out how it is that these publications are not seen at present and how they could be better distributed. I understand you send it to the clerks of the County Councils free of charge?—Yes.

15229. Then why should not it be sent to the man who is much more competent to deal with it. I have two annual reports here; which report are you referring to. Is this Annual Report on the Distribution of Grants sent to anybody?—Yes.

15230. To whom is that sent?—First of all that is sent to the Education Secretary of each County Council, and in addition to that, we write and ask them how many copies they would like to have for their agricultural or education committee.

15231. (By Mr. Latham.) Are we to take it for granted that the whole of the publications of the Board of Agriculture are to be distributed throughout the country free of cost?—We could not distribute bulky publications like the Board of Agriculture Report without very considerable expense.

15232. (By Mr. Medd.) How can you explain that people distinguished in agriculture and education have no knowledge whatever of these publications. Sir Thomas Acland, the other day, giving evidence here, said when a document of yours was put in his hand, that he had never seen or heard of it before. That was issued by your Intelligence Department. If Sir Thomas Acland, a man who has been chairman of the Devonshire Education Committee from its commencement, had never even seen or heard of its publication, how can you effectively claim that you bring these to the notice of the public?—I think the reason why Sir Thomas Acland did not know of it is very probably the reason that the Chairman mentioned just now, that persons in Sir Thomas Acland's position get such a very large number of publications sent to them of one kind and another, that they have not time to read them, and very often do not know what they have actually received.

15233. There was another witness who made identically the same remark as Sir Thomas Acland?—We have a list of about 10,000 persons to whom we send a copy of every leaflet as soon as possible after it comes out. We send it to all the newspapers; we have a notice put up in the post offices informing people where they can get the leaflets; we have inspectors going about recommending our leaflets; the inspectors of the Board of Education recommend their use in every one of the elementary

Mr. A. G. L.
Rogers.
16 July, 1907.

schools; and in addition to that, as I say, you will find in the report mention is made of the other ways that have been taken to distribute them. I think our annual distribution of leaflets is about a million and a half.

15234. (*By Mr. Acland.*) You think they do adequately get into the hands of the public if there is such a large distribution as that?—I do not think it is complete. I think we are getting on and I think in time we shall extend the circulation of the leaflets even more; but I think it would be a mistake to say that the leaflets were not known.

15235. (*By Lord Belper.*) They must be known to some extent, no doubt; but the question is whether all these publications do get into the hands of the people who are interested in them and how much they do get into their hands?—With regard to the leaflets or the Annual Report?

15236. I am speaking generally of them all, but specially with regard to the reports. The leaflets, as you say, no doubt are distributed under certain circumstances, and very large numbers are likely to be required especially where they deal with some pest or disease, but talking of the things generally, I very much doubt whether they get into the hands of the people who are interested in them as much as they ought to do. Do you ever write to anybody connected with agriculture and ask them whether they would like to have a copy of these publications?—Such as?

15237. This report and the other report and things of that sort—there are two reports here?—You are referring to the Annual Report?

15238. I have two, one with regard to the Distribution of Grants for Agricultural Education and Research. That is sent to nobody, you say?—The Education Report?

15239. Yes.—The Education Report is sent to the Education Committee of every County Council, and, in addition to that, a letter is sent to that committee asking them how many copies of that they would like. The greater part of that report is reprinted under another title and several hundreds of copies have been distributed; practically every member of the Education Committees in most of the County Councils have had it.

15240. I rather gathered you said it would be a considerable expense to send it to a large number of persons. Do these publications pay their way at present?—The publications printed at the Board's expense and sold by the Board all pay their way practically; the publications which are issued by the Stationery Office we are not responsible for.

15241. Which is that?—The Annual Report.

15242. Why should the Annual Report be printed by the Stationery Office while all the other reports are printed by the Board and made to pay?—The Annual Report is a Command Paper; it is laid on the table of the House, and all papers that are laid on the table of the House are published by the Stationery Office.

15243. Do you mean according to the regulations that it is a necessity that it should be printed by the Stationery Office if it has to be laid on the table of the House?—Yes, I understand that is what the Stationery Office is for; that the Stationery Office was formed for the purpose of seeing to the distribution and sale of Government publications.

15244. It seems a rather curious distinction if you have a certain number of publications which are under your control and which you are able to deal with in such a satisfactory manner that you can make them pay, that a particular report is taken out of your hands and printed by another department and you do not know whether it does pay or not?—I do not.

15245. You have nothing to do with that?—No.

15246. I do not know that we can carry it any further, but I have had circulars from the Board of Trade, with regard to trade and asking me whether I would like copies of certain publications, but I certainly have not had anything in that way from the Agricultural Department of the Board of Agriculture.

15247. (*Lord Barnard.*) This report of 150 pages, roughly speaking, is not drawn up in pursuance of an Act of Parliament at all, as far as I can make out. I have looked at the Act. It is a report not by the Board but a report to the Secretary of the Board by various departments, and then it is laid on the table of the House and published as a Command Paper. I should have thought it would have been much more useful if it had been published even

in the shape of a Christmas number or anything like that rather than by laying it before Parliament.

15248. (*By Lord Belper.*) I see this Education Report is presented to Parliament?—Yes.

15249. And printed by His Majesty's Stationery Office?—Yes.

15250. In the same way as the other Annual Report?—Yes.

15251. Therefore, you have no control over the printing?—No.

15252. Or the distribution?—No.

15253. Would you think that it might be desirable, you knowing the people who are interested in these reports, that the distribution should be from the Board and not from the Stationery Office?—I can hardly express an opinion as to that.

15254. I find the leaflets are also printed by the Stationery Office—you are, therefore, not responsible for those either?—Yes, we are.

15255. Where do you draw the distinction? Certain reports are printed by the Stationery Office with which you have nothing to do and certain others that you have to do with are printed for the Stationery Office. Is that it?—Yes.

15256. (*By Lord Barnard.*) The Stationery Office have to get them printed, but it is the same thing?—Yes.

15257. (*By Lord Belper.*) Is this one of the things you make a profit on?—The money for printing that is supplied from the Board of Agriculture vote.

15258. (*By Lord Barnard.*) To sum up your opinion as to the collection and dissemination of information you might give to the Committee what you omitted to state in your description of the department of which you are the head, the fact that all this work is based on Sub-sections 2 and 3 of Section 2 of the Act of 1889 which creates the Board?—Yes.

15259. (*By Mr. Staveley-Hill.*) Recently in the newspapers you published some information in respect to ensilage, and you further suggested that application should be made for leaflets?—Yes.

15260. Have there been any such applications?—We have had a very large number, about 3,000 letters, I think, from persons all over the country, nearly every one of whom are farmers. These persons asked for a copy of the leaflet for their own use. A certain number of persons have written up asking for further copies for distribution amongst their friends, and agents have written to ask for copies for distribution to the tenants on their estates, but nearly every one of the letters show quite clearly on them the mark of the practical farmer or the person intimately engaged in agriculture.

15261. (*By Lord Barnard.*) Before we pass away from the subject of leaflets, I should like to ask you this question—I am not sure that you have not given us some information on it already. I observe that these leaflets are revised from time to time and kept up to date?—That is so. May I make one statement as to the notice about the *Journal*. Every year, in the months of September and October, copies of one of the agricultural returns are sent to every occupier of 20 acres and upwards in Great Britain. There are about 250,000 of such persons, and we always take the opportunity of sending round some notice or other relating to the work of the Board at the same time. Two years ago we sent round a notice about the *Journal*, so that every occupier of 20 acres and upwards received a notice about the Board's *Journal*. We are proposing to do the same thing again this year.

15262. Might I ask you how many publications the Board issue regularly. We have heard of the leaflets, you have mentioned the Annual Report published by the Intelligence Division, and we have also all got in our hands the Annual Report as to the Distribution of Grants; is there any other publication?—There is also the *Journal*. We publish a set of diagrams illustrating diseases of fruit trees which we sell; we also issue two publications, which are given on that list, free.

15263. I see that you publish a list of the Annual Reports and other publications of the Board?—That is so.

15264. Is this paper largely circulated amongst agriculturists?—Very largely. Every person who applies for a leaflet receives in return not only the leaflet but this paper.

15265. So that every step is taken to make all the publications of the Board widely known?—That is so.

Mr. A. G. L.
Rogers.
—
16 July, 1907.
—

15266. In your opinion, and perhaps you are speaking for your colleagues as well, the publications of the Board at the present time circulate very largely amongst agriculturists and probably that circulation is increasing?—They do. I think there are very few places where they are not known, and I think the circulation is very largely increasing.

15267. Will you take your next heading, the relation of the Intelligence Branch to Colleges exemplified by the Milk Testing Scheme and Manurial Experiments?—I wanted to give that as an example to show the way in which the Board, to a certain extent, co-ordinates the work of the colleges, and the way in which I think it might do so further still. When the Sale of Milk Regulations were passed in 1901, it was, of course, quite obvious that since every farmer was responsible for the condition of the milk that he sent to market, it was necessary for him to have some kind of test so that he could see whether the milk which he got from the cow contained more than the 3 per cent. of butter fat and the 8·5 of other solids required by the regulations. Dr. Thorpe spent some time trying to find out a cheap method by which the farmer could test that for himself, but came to the conclusion that every method that a farmer could employ himself was untrustworthy. It was then suggested that something might be done through the colleges, and when we set to work to inquire we found that one college at least had started a scheme already for testing the milk of the farmers in its district at the rate of 6d. a sample, and that one or two other places were working on somewhat similar lines with certain modifications. For instance, Essex was charging 1s., and one of the places in Scotland was doing it for nothing. The Board collected all the conditions under which the different colleges were prepared to test the milk samples, and embodied them all in a series of suggestions which were sent round to all the colleges. We proposed that they should in every case reduce the price to 6d. where they were charging more, and in those cases where they had not got any scheme we suggested that they should start one. By those means we got every one of the colleges and certain other institutions to agree to give a uniform test at 6d. a sample, and in the case of the Midland College to give a test at 9d. for those counties which are not connected with any agricultural college, so that now the whole country is covered. We then drew up a couple of forms which we suggested the colleges might use—forms of report on the samples—and we had them printed and distributed to the colleges. We also printed a leaflet explaining what it is the colleges were now offering to do and distributed that very largely in every way we could think of throughout the country. We sent it not only through the ordinary channels, but we sent large numbers of copies to different bodies like the Aylesbury Dairy Co. We then published a series of articles in the *Journal*, showing the advantages to farmers of having their milk tested in order that they might find out whether the quality of the milk which was yielded by the cow was up to the standard expected. I have since found out that the number of samples submitted to the colleges very largely increased last year, which was the first year this was in working order, and we hope by bringing this scheme more to the attention of farmers continually, whenever opportunity arises, to induce them to send in even more.

15268. The operation of the Board has practically been to bring a cheap method of analysing milk to the door of every dairy farmer?—Yes, and to secure uniformity in the work throughout Great Britain.

15269. That is to the advantage of the Board as well as to the advantage of the dealer?—Yes.

15270. I suppose you are aware that this operation on the part of the Board has had two effects, while benefiting the actual dairy farmer it has, to a certain extent, aroused apprehension on the part of the analytical chemist. Are you aware of that?—Yes. The Society of Chemical Industry sent a letter to the Board formally complaining that the effect of this scheme had been to make several of the local authorities raise the question of the fees which they proposed to pay to their official analysts. These local authorities, having apparently seen that milk could be tested for 6d., said "Why should we pay a guinea," or half a guinea as the case may be, "to an analyst to have an analysis of the milk" which was practically, as they thought, no better than the test supplied by the colleges. The Society brought this to the notice of the Board and complained that our scheme had injured their position. In reply, the Board explained that they did not agree with the view of the local authorities for several reasons. In the first place the tests as carried out by the colleges are not full analyses. They are not chemical tests at all but mechanical tests. Secondly, it is quite obvious that

no farmer could afford to pay the fee which a chemist would charge for testing milk, and that therefore he must have these 6d. tests or no test at all. In the third place we pointed out that these tests were for the farmers' information alone: that they were issued on the understanding that they were not to be used in a court of law.

15271. I suppose if it was really a case that was likely to go before the court the proper course would be to employ a chemist and produce him as an expert witness?—Exactly. The farmer wanted these tests for the purpose of finding out whether the cow was giving the kind of milk he wanted, and consequently a number of tests was absolutely essential. One single test would tell him nothing. On the other hand, a local authority takes samples of milk for the purpose of enforcing the Food and Drugs Acts. If they are found to be defective the seller has to be put on his trial for selling milk which is alleged to be adulterated, and it would be a most improper thing to take a rough mechanical test as evidence in a court of law where if judgment was given against a man he might be ruined. For purposes of that kind an accurate chemical test was the only thing that could possibly be trusted. Therefore the two situations are absolutely different, and we asserted that, whilst we should still maintain our position that the farmers ought to be allowed to have these 6d. tests for the purpose of educating themselves, we should very strongly oppose such a test being used for the purposes of enforcing the Sale of Food and Drugs Acts.

15272. For trade purposes?—For trade purposes.

15273. I suppose something of the same kind is done although perhaps not exactly under the aegis of the Board, in connection with the analyses under the Fertilisers and Feeding Stuffs Act?—Something of the same sort is done by some of the colleges.

15274. They are perhaps not strictly speaking chemical analyses, but some simple explanation of the conditions?—I am not quite certain, but so far as I know I believe those samples are sent up chiefly to find out whether the purchaser is paying a proper price.

15275. We have been told that farmers actually prefer them because they get more informal and useful information through the colleges than they do from the official result of the analyst under the Act?—I have no knowledge of those tests. I can only speak with regard to the milk tests.

15276. What are the manurial experiments to which you refer here?—That was a publication which the Board published in order to secure uniformity. It has been very widely distributed throughout the country.

15277. Now next we come to "Closer relation of Colleges to Intelligence Branch"; you consider that can be done by the publication of reports, and by investigations of local conditions?—I think that has been practically touched upon already. I only wish to emphasise the fact that the Board depend to a very great extent upon the agricultural colleges for the purpose of getting information, and that although the Correspondents are exceedingly useful for many purposes, there are other purposes for which it is much better to trust to the agricultural colleges.

15278. You are of opinion, I think you dropped some words which indicated it, that this relationship of the Board of Agriculture to the Colleges might be made more useful and expanded further?—I believe so, certainly.

15279. That is to say making the colleges as I said just now to a limited extent and for certain purposes agents of the Board?—Yes.

15280. You are of opinion that the Board is in a better position to collect and disseminate information such as that we have just been touching upon than voluntary or local institutions?—Yes. The advantageous position of the Board lies in the fact that they are the central body to which every one of these colleges go sooner or later. Take a concrete example. Say Armstrong College conduct certain experiments; they publish a report; that report is sent round to the agricultural press and to the local press. Two years afterwards it is probably forgotten; nobody knows where to get it; if you write to a bookseller for it he knows nothing about it; if you write to Armstrong College possibly they may have copies still, but possibly the supply may be entirely exhausted. At any rate people do not always remember who it is that published any particular report, and they do not know to whom to apply for copies. If, on the other hand, the person writes to the Board of Agriculture he can find the report in the Board's library; it can be consulted there, and if necessary it can be borrowed from there. But what I should like to point out is that it would be a further advantage that all those

reports should not only be sent to the Board after publication, but should be published by the Board in the first place. The Board should be the central authority which should publish all the information and reports dealing with agricultural experiments.

15281. One aspect of the question which we have discussed in this room already is that the result of all experiments conducted by institutions subsidised by the Board should, in part at any rate, be the property of the Board as public property, and used for the benefit of the agriculturists at large?—Quite so.

15282. Is there any other point in that connection that you wish to mention?—I should like to say that just as we have secured uniformity in the milk tests, so we are trying to secure uniformity in dealing with the subject of insect pests. We find that each county knows perfectly well what pests they have got. The experts at Wye know what they have got in Kent, and the experts in the North of England know what they have got there; but it very seldom happens that the people in the South of England know what people in the North of England have got, and very often they are unable to find the best means of discovering it. I suggest that all this work should be done through the Intelligence Division of the Board of Agriculture.

15283. I suppose the idea you have in your head would include informing one college of what was being done at another, so as to prevent unnecessary duplication or overlapping?—Yes.

15284. Of course it might be necessary that two colleges in totally different parts should be doing the same work in order to find out whether the same result is produced under different climatic and geographical conditions?—Undoubtedly; but the work in one part would not be useful without a knowledge of what was being done in the other part.

15285. Is there anything that I have not touched upon on this particular branch of your *précis* that you would like to add?—I do not think so.

15286. (*By Lord Belper.*) No doubt you quite understand it is a great advantage that the Board should be informed of all the experiments, and have a knowledge with regard to all the experiments, that are carried on at the different colleges; but do you propose that the Board should distribute the information about that locally as well as generally, because it does not seem to me, from our experience, that the Board is the best means of distributing knowledge, especially locally. The object, in the first instance, of the experiments is to put the farmers in the neighbourhood in possession of everything that has taken place, so that it may be useful to them in the conduct of their business; but surely that could be better done by the college itself than by having the thing published by the Board and then distributed by the Board?—My idea is that the thing should be published by the Board, and the distribution locally would, of course, be done by the college which carried it out. If Armstrong College, for example, conducted an experiment and the reports were published by the Board, of course it would be to the interest of the Newcastle College to distribute that in their own district.

15287. You would take upon yourself the expense of publishing these papers, and sending to the college which had initiated the experiments any amount of copies that they might require for local distribution?—Yes. We have already started that to a certain extent. I daresay you will have noticed that the reports of the Poultry Department at Reading are all published by the Board now? They were formerly published separately, and even now we have a certain number of copies printed which we send to Reading for distribution; but the information appears in the Board's *Journal*, and is therefore distributed to all parts of the kingdom, and is readily available to anyone wishing to consult the report again.

15288. Let us see what the financial aspect is. Do you propose to take the whole of the cost of publishing them?—It would depend, of course, a great deal on the amount of publication it was proposed to do.

15289. It is a matter which would be extremely favourably received by the colleges if you were going to relieve them of the expense of publishing. If you are going to do it merely in order that the Board may be able to disseminate the knowledge amongst other counties as well as amongst their own, of course the college might not look so favourably upon it, at all events if your publishing it cost no more than the cost of publishing it themselves would amount to?—It would be a matter for consideration.

15290. Yes, but I want your idea. It seems to me if the Board publishes, they must take the responsibility and pay for the publication, possibly charging the counties a certain amount for the copies and for the information they supply. But, at all events, it seems to me if you are to be responsible for the publication you should also be responsible for the cost of the publication. What do you say to that?—Yes: if the publication were made through the *Journal* of the Board of Agriculture that would be so.

15291. There would be certain to be a feeling of this kind, would there not: "If we had done it ourselves it would have been done more economically than the Board have done it." I do not say the feeling is justified, but people often say that kind of thing, that if they had done it themselves they could have done it much more economically. But they would not object if the cost was borne by the Board?—It would, of course, have to be done by some arrangement.

15292. No doubt it would all be part of the wide financial arrangements that may come about in the future?—Certainly.

15293. But you think it is desirable that it should be done in that way?—Yes.

15294. I suppose you have no suggestion to make further than you have done with regard to the point of view you were discussing as to the distribution of these papers which are published by your department?—Do you mean with regard to the Annual Report or to the leaflets?

15295. With regard to any of them. I mean, assuming there can be some improvement in the system of the present distribution, have you any suggestion to make?—I have no suggestions to make with regard to the Annual Report, because that is a grant made to us by the Treasury.

15296. That depends on the Treasury?—That depends on the Treasury entirely; I cannot speak as to that at all.

15297. Now with regard to the others?—With regard to the distribution of the leaflets and the other publications of that sort which are actually the Board's own publications, I have no further suggestions to offer, except to say that I should be glad if anybody would make suggestions to me.

15298. (*By Lord Moreton.*) When you advocate the Board of Agriculture publishing the results of the investigations and experiments carried on at the colleges, would you also desire to see being made public in the same way the investigations and experiments that are carried on by the various agricultural societies?—Yes, to a certain extent, at any rate.

15299. How far do you think the agricultural societies would accept that suggestion with equanimity?—Of course that opens up the whole of the question as to the way in which agricultural experiments are carried on in this country, and how they ought to be carried on.

15300. Let me suggest this. Supposing an agricultural society has carried on a long series of investigations of a particular kind, then it seems to me the Board of Agriculture, just at the moment the society was going to gain some "kudos" and was going to publish a matter of very great interest to its members, a matter which has been the result of a considerable expenditure of time and money, would step in, because that is what your suggestion seems to involve, and take away the "kudos" that the society itself would obtain?—Would it take away from the "kudos" of the society if the Board were to publish the results of the investigations of the society and make them wider known than they could do themselves?

15301. I am only speaking on my own behalf, but as a very old member of the Royal Agricultural Society, it seems to me it would be rather hard, after that Society had spent much money and a great deal of time on investigating some particular point, that that information, instead of appearing in our own publication to our own members, should appear in a publication of the Government department?—Of course, in the case of the Royal Agricultural Society of England the case is entirely different, because they have a publication of their own which is a standard publication.

15302. I think the Bath and West and the Highland also have publications of their own?—Yes.

15303. What do you say with regard to those societies or bodies which have publications of their own?—Their annual publications stand in exactly the same position as the *Board of Agriculture Journal*. They are publications which everybody knows about, and which everybody can consult by going to any good library.

Mr. A. G. L.
Rogers.

16 July, 1907.

Mr. A. G. L.
Rogers.
—
16 July, 1907.
—

15304. Therefore I rather gather from what you say now in those cases where there are no publications the question is on a different footing?—Quite.

15305. (*By Lord Belper.*) To make it quite clear, you would publish these papers under the name of the college who had made the experiments; or, if it was a case of research, of the person who had made the discoveries?—Of course.

15306. They would have the full credit of it, although they were all published through your publication department?—Yes, certainly, just as an author gets the full credit for a book he writes, although it is published by a publisher.

15307. You were talking with regard to the Sale of Food and Drugs Acts. The Board of Agriculture are responsible for dealing with the administration of those Acts, are they not?—Yes, and the Local Government Board.

15308. Is the Board of Agriculture solely responsible, or is it the Local Government Board?—The Local Government Board is also responsible.

15309. In your earlier evidence you gave some information with regard to the administration of those Acts. What is the distinction between the part of the work which you deal with, and the part which the Local Government Board deals with?—Roughly speaking, the Board of Agriculture represent the farmer, the producer, and the Local Government Board represent the consumer.

15310. I think all the regulations at all events have to go through the Local Government Board, have they not?—Not the regulations of our Board.

15311. We had the other day a number of new regulations with regard to carrying out the Food and Drugs Act. Were those issued by the Board of Agriculture?—The Sale of Milk Regulations, 1901, were issued by the Board of Agriculture.

15312. With regard to the adulteration of spirits and those sort of things, do they come under your department?—No, not at all; that is the Local Government Board.

15313. And the weights and measures?—That is the Local Government Board also.

15314. So I thought; but I did not gather from your evidence that you made any distinction between them?—There are a very large number of subjects which the Board of Agriculture deal with, though we do not administer the Acts of Parliament concerning them.

15315. The administration is by the local authorities, but before they come to the administration, there are certain regulations which have to be approved by some Government department. In the case of a great part of the duties under the Food and Drugs Acts, that, at all events, is under the Local Government Board?—That is so.

15316. There are certain things which you solely deal with?—Yes.

15317. Would you just mention what those are?—They are the Fertilisers and Feeding Stuffs Act and certain parts of the Sale of Food and Drugs Acts—I have forgotten what the clauses are now.

15318. Certain analyses, I suppose, for discovering adulteration in butter and things of that kind, does that go through you or does that go through the Local Government Board?—Through us.

15319. Is the line between the two departments quite clear?—It is defined by the Act of Parliament.

15320. I know; but sometimes Acts of Parliament do not foresee what is going to take place afterwards, and there is sometimes considerable confusion between two different Government departments dealing with Acts which are administered by the same authority and through the same officers. Do you think there is any confusion in this case?—I have never heard of any difficulty between the two departments.

15321. (*By Mr. Acland.*) Is your view as to publication of results of research by the Board of Agriculture rather your own opinion, or has it been considered as a practical matter by the Board of Agriculture. Is it a pious opinion of your own, or do you think it is likely to be possible to carry it out?—It is a pious opinion of my own; how far my opinions may influence the Board I do not know.

15322. The Board has not made any enquiries or efforts yet to see how far the authorities concerned would welcome that idea?—No.

15323. You, yourself, from your experience of these bodies, do not think it impossible?—I do not think it impossible. I think there are a good many difficulties,

but I think that is possibly one of the things which this Committee will consider.

15324. Have you ever thought of having stands or stalls at big agricultural shows for the purpose of distribution and explanation of the results of experiments and research in the country?—We have had the pavilion at the Royal for the last three or four years—four years I think it is; we have been represented at the Yorkshire Agricultural Society for two years; last year we were also represented at the Lincoln Show; and this year, in addition to the Royal, we had a stand at the Somerset Agricultural Society, at the Bath and West, and at the Highland, and we are going to have one at the Yorkshire Society's Show in August.

15325. (*By Professor Middleton.*) Those are practically all the shows lasting three days or more?—Most of them have been four to five day shows.

15326. I mean that we are represented at all the big shows?—Yes, at all the long ones.

15327. (*By Mr. Acland.*) Do you consider that the expenditure in that way has been justified?—Quite, I think it has been most usefully employed.

15328. Do you distribute there not only your own publications but the publications of the other bodies in the way of research and so on as well?—No, only our own.

15329. Do you think it would be possible to work in with other bodies in that direction, such as Newcastle and Leeds and so on, and distribute their publications in addition to your own?—I think it might be done, but with the present method of printing and publishing these leaflets it would be very difficult. When we were down at Wells, for instance, we might have had some of the pamphlets of the Leeds University to distribute there, but I do not think there would be at present any very great demand in Somerset for these pamphlets; and if we were distributing in Yorkshire, of course the Leeds University would have their own stand there themselves.

15330. No efforts have been made to make your stands at these shows centres for the distribution of the results of all the research in the country?—No.

15331. Do you think that that would be a possible development?—I think it might be, but I think as it is at present arranged it would be rather difficult. I think we want to get into closer connection with the Colleges before we attempt anything of that sort.

15332. You are particularly interested in history, is not that so?—I am.

15333. Do the results of your historical study give you any views that you would like to express to us as to the particular needs for aiding agriculture and as to any particular ways in which it might be aided?—I am afraid I have hardly ever looked at the subject from that point of view and I could not give an answer off-hand.

15334. If you were asked to make a statement justifying the giving of more State money you would be able to draw upon your historical knowledge?—Yes, I should be quite prepared to make a statement on that point.

15335. (*By Professor Middleton.*) Lord Moreton asked you about the publication of the results of work done by agricultural societies, but would not such work have quite a different relation to the Board from the work which is done by colleges subsidised by the Board?—Certainly.

15336. I do not think you meant to suggest that all the publications of the colleges should be published by the Board of Agriculture?—I hope I did not say so, I did not intend to suggest that their leaflets should be so published.

15337. I wanted to make it quite clear that you do not suggest that all the material which is at present published by the different colleges should be published by the Board of Agriculture?—No, that is not so.

15338. Your suggestion referred to selected material entirely?—Yes.

15339. (*By Lord Belper.*) On that I should like to ask, would it not be putting a college in a difficult position if they had to wait before publishing these things for the Board of Agriculture to decide whether certain things should be published or not, and then have thrown on their hands to publish certain things that they might not at the moment have made arrangements for publishing?—The Board of Agriculture give certain grants to the agricultural colleges, primarily no doubt, for educational purposes, but to a certain extent with an eye to questions of research, and it seems to me a good thing that

the Board of Agriculture should have some controlling voice upon the research that is carried out and upon the publication of those reports.

15340. I quite understand that, but it seems to me, as I said before, that you may have experiments with regard to a particular part of one county, the reports on which would be extremely useful for the county and are certainly useful for the purpose of education in that county; but it might be that some similar experiments in another county at the other end of England, which had already been published by the Board, would not be useful in that other county, because local knowledge may be different and there may be different circumstances that you would not wish entirely to rely upon for your own county, and you might think it desirable to carry on your own experiments. If those are not published by the Board, although they are going to publish all the other experiments, I should very much doubt if it is a desirable system to carry out from my point of view?—I do not think the system would really be difficult. I am afraid the probability is that I have not made my idea very clear to you.

15341. (*By Lord Barnard.*) Perhaps I have helped to convey a wrong impression. The suggestion I wished to put to you was in the case of all societies, particularly those which received grants from the Government and, of course, that would not apply to the Royal Agricultural Society at all; but in the case of all institutions at the present time who receive subsidies from the Government through the Board, you think that the Board should have some proprietary interest in their publications. I do not for one moment intend to convey by my question that the institution should be debarred from equally making any use of their own publications, but merely that the Board should have a right as well as the institution to the results of their experimental and research work?—Exactly.

15342. (*By Lord Belper.*) Then upon that, may I ask you whether it would not be far better that there should be no special publication by the Board of the experiments which are made by a particular institution, but that the colleges should publish them and that they should in all cases send a copy of their publications to the Board of Agriculture to make whatever use they like of in the way of disseminating the knowledge. That seems to me the simplest plan. If the Board of Agriculture when they have got these results are going to say we will not publish this and we will not publish that, it seems to me the simplest thing is that they should not publish anything at all, but should have copies of everything sent to them which they could reprint if they thought it desirable?—I do not think my suggestion implies guiding or controlling the local institutions in the manner you fear.

15343. It seemed to me that your object is entirely met by saying that in all cases the Board should have the information given them and copies of any reports or results of experiments?—And that the Board should see to the distribution of those reports throughout the country?

15344. Yes, and make use of them in any way they like?—The objection to that is that supposing a person wishes to make a collection of reports on experiments conducted by the different colleges in England, he would find that very nearly all of them are printed in different forms. One is a little bigger and another is a little smaller, and that, in itself, is a disadvantage, whereas if they were all printed in the same form and of the same size, they would be much easier to follow as well as to bind.

15345. There is a difficulty so far as the colleges are concerned if they do not know when their reports are drawn up and before they are published whether the Board is going to publish them or not. I leave that to be met by a suggestion, but I am bound to put it from the point of view of a college. Anybody who knows anything about publishing knows that people can make very economical arrangements if they can estimate the amount they are going to have printed within a certain period, but if they have a great amount of information thrown on their hands at a moment's notice it may be very expensive and inconvenient to publish it at such short notice?—That is so.

15346. (*By Mr. Latham.*) Will you look at these cards (*handing some milk test certificates*)?—Thank you.

15347. If a Show makes an application to you to take a stand there, are you always willing to accede to the application?—Not always, because we have only a very small staff. Besides the three assistant heads we have only four clerks, and I have had one of them away all last week at the Highland Show, while, as you know, Mr. French has been here. That takes 50 per cent. of the

staff off, and we cannot get through the whole of our work in consequence.

15348. Mr. French being here is only a temporary thing. There is no way of introducing these things so well as in the show yard, is there?—I quite agree, and if we could spare anyone, we should certainly do it.

15349. With regard to those cards that I handed to you, do you not think that is as far as the small local authorities should go?—Just giving that information on the cards? I think it would be very desirable, and I think it is done in a good many places, that they should give advice as to the probable causes of deficient milk supply.

15350. That is not what I mean. I mean the way in which the milk is analysed by these small authorities is very often misleading and rather dangerous?—You mean under the Sale of Foods and Drugs Act?

15351. Yes. Farmers are often led astray, whereas had they proper analyses if would prevent them feeling that they are in a better position than they really are?—The analyses under the Sale of Foods and Drugs Act are always made by a chemist.

15352. To a certain extent I agree. We have had a witness before us who has very graphically described what you have described, and I agree with every word of it. We have always felt if farmers only knew as much as is on those cards that I handed to you they are apt to be often more self-confident than perhaps they ought to be?—Yes, I think it is very likely if a farmer has had the milk of his cows tested frequently and knew the sort of milk they were giving he would face the ordeal of an accusation in court with much more confidence than if he had not had those tests taken.

15353. I myself have formed very strong conclusions as to it that perhaps a little learning is a dangerous thing, and that if a farmer had these cards giving him this kind of information he is not so safe as if he had a qualified analyst sent down to him, such as Dr. Voelcker?—That is quite possible, I think.

15354. Have you anything to say with regard to market reports?—They are not issued by the Intelligence Branch.

15355. No, but there is an impression that they are not quite so useful as they might be. Do you think they could be enlarged?—I think it would probably require a good deal of additional organisation, but, of course, as they are not issued by my department I am not really familiar with the details.

15356. No, but I dare say you have heard it expressed that they are not as thorough as they might be?—Yes.

15357. Do you think they cover the ground sufficiently for the ordinary agriculturist to take sufficient notice of them?—I think that all the publications of the Board are capable of improvement.

15358. (*By Lord Barnard.*) Now, to go to the other part of your *précis*, I understand your department collect agricultural information from various foreign countries?—That is so.

15359. Does that extend to British Colonies?—Yes.

15360. Are you in touch with the agricultural departments and the officers of the various agricultural societies in the Colonies?—We receive all their official publications.

15361. You have to communicate with them through the Foreign Office, I suppose?—We communicate with the Colonies through the Colonial Office.

15362. Yes, but with foreign countries how do you get into communication with them, if you want to know what they are doing on any particular subject?—Of course official information is obtained through the embassies and consular service. But we get a good deal privately through the officers of foreign departments.

15363. Do you furnish foreign countries with what is done in this country?—Officially?

15364. No, unofficially?—Yes, I know several gentlemen connected with agriculture in foreign countries and we frequently correspond with each other.

15365. I understand you do not speak from personal knowledge of the agricultural organisations of foreign Governments?—No, I have no personal knowledge. I have never been abroad to inspect any of these bodies.

15366. Your information is merely obtained from reading their reports?—The only information that I can give is that supplied by the foreign authorities themselves.

15367. It is really very important, to my mind at any rate, that this Committee should have such information as the Board of Agriculture can give it on the subject

Mr. A. G. L. Rogers.

16 July, 1907.

Mr. A. G. L.
Rogers.
16 July, 1907.

referred to us, that is to say, the facilities afforded for scientific and technical instruction in agriculture. Can you give the Committee any evidence, not from every country in Europe, but from any country that you would like to select as being most useful to us as an illustration of what is done by foreign countries in this respect?—I have a good deal of information on the subject, but I am afraid I am not quite sure what the information is that the Committee want.

15368. They do not know what they want really. They really want to know what you can tell them. You know quite as well as we do the terms of the reference to this Committee. The information that the Committee would like is information as to what other European countries, and other foreign countries I might say, including our own Colonies, do in the way of encouraging scientific and technical instruction in agriculture, and what the result of that encouragement is. Would you take one selected country first?—Perhaps I might put it rather from this point of view, that the information which I am able to give and of which I have been making a study for some time past, is rather the relation of the different departments of agriculture in foreign countries to agricultural education.

15369. Please give us your views in your own words?—In that case perhaps I might begin with Belgium, which I have selected to give first because it seemed to me that Belgium is the country in which agricultural education is most highly organised, in one sense at any rate.

15370. Before you describe them I suppose you are familiar with all the places in this country and the systems pursued there?—Yes.

15371. So that you can compare them?—I am afraid I shall find it exceedingly difficult to compare the systems abroad with any of the systems practised here, because my feeling is that they are entirely different.

15372. What we should like to know first is what the system is in any foreign country that you like to select to begin with, and then if you will indicate to us your view as to how that system, or any part of it, could be adapted to this country. Take Belgium first, you were beginning with Belgium?—In the case of Belgium I suppose the most distinctive thing about Belgium is that every kind of agricultural education is more or less organised, and organised under the Department of Agriculture. With the single exception of a certain kind of intermediate education, I believe everything emanates directly from the Government. There are a certain number of private schools which are subsidised, and, of course, the University of Louvain supplies a certain amount of agricultural education. But otherwise everything from Gembloux through all the different grades of education down to the most elementary and simple, such as the instruction for soldiers and the instruction for farmers' wives and the lectures given by the travelling professors are all organised by the Government.

15373. When you say organised by the Government do you mean that the schools are established by Government and supported by Government?—Yes.

15374. I do not know how far you would like to go. Would you agree with me in thinking that such a system would not be suitable to our English customs?—I quite agree.

15375. Could we, with advantage, copy any modification of such a system, that is to say, by further extending the influence and support of the Board of Agriculture over all these institutions?—Yes, I think a great deal might be done in that way.

15376. We must bear in mind that in England all the organisations with which we are now dealing have sprung up in the last 20 years?—Yes.

15377. In France and Belgium, for example, has the system been in force longer there do you know by any chance?—The present system?

15378. Has there been a system? There was no system at all in England 20 years ago?—I should say practically all the organisation of agricultural education that exists in France and Belgium, and almost every European country, has sprung up within the last 20 or 30 years.

15379. So that we are not peculiar in that respect at all?—No.

15380. But they have gone very much farther ahead of us in the way of Government activity?—Quite so, if you consider Government activity going ahead.

15381. We have had very clear information given us as to the amount of money at the control of the Depart-

ment of Agriculture and Technical Instruction in Ireland. We have also had some evidence on a similar point as to Scotland. As you are aware, in the case of Ireland, that the sum expended on the agricultural industry is incomparably larger than that spent in England?—That is so.

15382. Do Belgium and France in any way resemble Ireland, or do you think that they spend even more than is spent in Ireland?—They spend a great deal more than is spent in Ireland.

15383. Then we are so much behind France and Belgium in public expenditure?—Yes.

15384. You are familiar with the statement at the end of this Report on the Distribution of Grants?—Yes.

15385. You are aware that the sum provided by the Treasury last year was £10,500?—Yes.

15386. And that the sum voted by the County Councils amounted to just under £84,000?—Yes.

15387. Making a total of less than £100,000?—Yes, a little less than £100,000. It would be practically impossible to find out how much money is spent by the local authorities in France on agricultural education.

15388. (By Mr. Acland.) Does that apply to other countries too?—Yes, I think it is practically impossible; I do not know of any means by which one could find out, but I should say by far the greater amount is given by the central Government in foreign countries. Nearly all of it comes from the central Government, and only a comparatively small amount from the local authorities.

15389. (By Lord Barnard.) You have studied the administrative system in France and Belgium, and probably other countries?—Yes.

15390. Is the assistance given by the French and Belgian Governments to the agricultural industry out of all proportion to the amount that is given by them to other industries, or are they equally generous to all the other industries in the State, do you know?—I should think that they probably give rather more to agriculture than they do to the other departments, because agriculture is treated in these countries as a big and important industry.

15391. We all know that with regard to shipping in France every effort is made by the Government to encourage the shipping industry, both the shipbuilding and the marine industry generally. What I want to know is, are they still more generous to the agricultural industry, or is their subsidy to agriculture, roughly speaking, on a par with the subsidy to the marine trade?—I could not say how much is voted towards that, but I know that a very large sum of money is given towards fostering agriculture in all these countries, and yet in France, just as in England, agriculturists complain bitterly that they contribute the greater part of the taxes and get only a small amount of the advantages.

15392. Can you give us any information on this point. Are these schools and institutions for educational purposes in France and Belgium very largely taken advantage of and appreciated by the agricultural classes?—My general impression—I am afraid it is only my own personal impression—is that on the whole they are not.

15393. That is the impression that I derived from a Foreign Office publication on agricultural education in France that I have been reading?—Yes. One of the tests for a thing of that kind is to consider not only how many persons attend the colleges, but what occupations they take up after they have left the colleges—what they go to. We have it on evidence given at the International Congress on Agricultural Education in 1905 that in Belgium only 5 to 10 per cent. of the students who pass through Gembloux take up agricultural pursuits when they leave.

15394. That would be an argument against too lavish a creation and support of these institutions by the State?—I think it would be an argument against giving an agricultural education to a number of persons who were not interested in agriculture. At Gembloux, for instance, they create a very large number of what are called agricultural engineers, and a very large number of the persons who pass through that institution become engineers.

15395. How can you pledge a youth, and still less, how can you pledge a boy, that he will take up agriculture?—I do not think you can do that. But I think you could affect him very largely by the kind of education that you give him when he is there.

15396. On the subject of the usefulness of these institutions, am I right in thinking that there is a doubt about the usefulness of similar institutions in America?—I should not have thought that the thing applied to America in the

same way. I am talking, of course, for the moment only of the question of higher education. The education in the intermediate schools in the French-speaking countries like Belgium and France is of quite a different order. I think, as far as France is concerned, that the schools which are known as the *école pratique* are admitted to be a failure.

15397. Does what you have said with regard to Belgium and France apply to Germany?—The system in Germany again is almost entirely different, because the organisation there is connected with the university system rather than with the Government system. In Belgium, of course, a certain amount is done through Louvain; in France comparatively little is done through the universities. In Germany nearly everything is done through the universities or institutions connected with the universities. Very little is done actually by the Government itself. For instance, even the popular lectures which are given by the *Wanderlehrer* in Germany are organised, I believe, by the agricultural societies and chambers of agriculture, and, though the Government give a subsidy, the organisation is almost in the hands of the agricultural societies. That is obviously an entirely different state of things to what prevails either in France or in this country.

15398. Do the separate North German States regulate this question each for themselves, do you know? I mean to say Prussia, Saxony and so on?—Yes. The German Empire has practically no system; they are nearly all done by the kingdoms.

15399. Do you know whether in any of these States that you mentioned in which subsidies are given to the societies those subsidies are substantial or not?—I believe they are, but I do not know what they are at all.

15400. You do not know whether any of these North German States spend large sums of money on agricultural education?—Yes, they spend considerable sums of money.

15401. (*By Professor Middleton.*) The Royal Agricultural High School at Berlin, for example, costs the Government about £27,000 a year?—Yes.

15402. That is one institution, and there are many others?—That is the Prussian, not the Imperial.

15403. (*By Lord Barnard.*) Are these universities subsidised by the State? Whence do they derive their resources?—I do not know, but they were all founded by the State originally.

15404. How about Austria, is that much in the same position as Germany?—Yes.

15405. Austria is very largely an agricultural country, is it not?—Very largely, and it is a country where there are a very large number of big estates, which is a state of things quite different from what prevails in Germany. I do not know whether you would care to hear it, but I think the best description of what goes on in Austria is given in a speech given by Professor Liebenberg.

15406. If you think it bears on the subject of our inquiry I think we might have it?—I think it gives a very accurate description of affairs; but I do not think the state of affairs in Austria is one to be copied.

15407. Perhaps you will summarise it then?—Briefly, although they have a very complete system of higher and intermediate education, the reason it is not a success is that all the persons who pass out of the lower grade of schools try and take positions which are intended to be filled by the students from the rank next above them. The intermediate people expect to fill the posts which ought to be held by the persons who have passed through the highest rank of all, and consequently the result is that everybody is filling a post for which he is not quite fitted.

15408. I believe the Austrian Government subsidise horse-breeding very largely, do not they?—Yes.

15409. Is that treated in any way as it is in Ireland?—They have a school there, but I am afraid I am not able to give very useful information about that.

15410. I suppose we need not consider Russia or Turkey, need we?—I do not think there is any education at all in Turkey. There is some in Russia, but I do not think there is any particular which we would care to copy here.

15411. We have been told that every man who passes through the ranks in Italy receives instruction in agriculture. Are you aware of that?—Yes.

15412. Could you just tell us what the reason for that is. Do you know at all?—The reason is, of course, really that the Government want all the men who pass through the

Army as far as possible to go back to the country again, and not to collect in the towns. *Mr. A. G. L. Rogers.*

15413. They are drawn from the country principally?—They are drawn from the country principally and they want them to go back to the country, and therefore they give them a kind of instruction which will be of use to them and enable them to go back to the country again. A good deal of the policy of the countries where there is conscription is guided by the question of finding recruits for the Army.

15414. The object of the Government is to make conscription as little objectionable as possible?—Yes. I do not know whether you have seen this paper [Cd. 3511], which has just been published by the War Office. There is at the end a memorandum written by Commandatore Vigone.

15415. One of our witnesses mentioned him?—It is mentioned here that the original of the memorandum was forwarded to the War Office by Mr. W. F. Reid.

15416. Yes. I suppose we need not consider Spain either?—I do not think the system in Spain is applicable to this country.

15417. I do not know whether there is anything of the kind in Switzerland?—Do you mean the education of the army?

15418. No, agricultural education generally?—Yes, they have a very active agricultural department in Switzerland.

15419. Are there any features there which might with advantage be either on the one hand avoided, or on the other hand copied?—I am afraid I do not know sufficient of the details about it, but I know their Agricultural Department is very energetic.

15420. Can you tell us anything about Denmark? We have heard a great deal about Denmark here?—The most important thing about Denmark, I think, is the education given in the *Landbrugsskoler*, which is theoretical education. If the Committee would like it, I should be prepared to make up a memorandum with regard to that.

15421. Yes, I think it would be an advantage if you would prepare a memorandum on Danish Agricultural Education?—Yes, I should be prepared to do that.

15422. Do you think you could extend that by tabulating what is done in all other countries of which you have information?—Yes, certainly.

15423. Of course you are aware that in an inquiry of this kind, it is not at all uncommon to send one or more members of the Committee to foreign countries which are especially well known in connection with a particular subject?—Yes.

15424. We have never suggested such a thing on this Committee, although it is one of the most important points that we have to consider in my judgment, because we understood that the Board of Agriculture had complete evidence on this subject here in London?—I believe we have.

15425. I suggest that you should prepare a tabular statement containing all such information as the Board of Agriculture have and that you will cause it to be circulated to every member of the Committee?—Yes. (*Statements on the condition of agricultural education in some thirty countries were subsequently prepared by the Intelligence Division of the Board and forwarded to the Committee.*)

15426. (*By Mr. Medd.*) There is nothing for us to learn from Belgium so far as your experience goes?—I think the only thing we could possibly learn from Belgium is the instruction for women and girls; I do not think there is anything else.

15427. With regard to boys' schools, they have not anything to teach us?—No.

15428. (*By Lord Belper.*) Do those reports from which you are going to draw the information to lay before the Committee, give information as to how far agricultural education is taken advantage of by those for whom it is intended, because I understood you to say in your examination that in one or two of those cases it was an absolute failure; I think that was the case with regard to Belgium?—I gave entirely a wrong impression if I gave the impression that the thing was a failure. I think I used the expression failure about something else. What I wanted to say was that at Gembloux, which is the highest place of education in Belgium, only five per cent. to 10 per cent. of the students go back and take up agricultural pursuits, but if I were to make the deduction from that that the thing was a failure, it would be wrong. The true deduction I believe is that the kind of education given is a sufficient training for other

Mr. A. G. L. Rogers.
16 July, 1907.

Mr. A. G. L. Rogers.
16 July, 1907.
kinds of pursuits. A great many of the men who have been through the training at Gembloux are not agriculturists at all; they never wanted to be; they take up pure science. It would be exactly the same if you took the students at Oxford and Cambridge, and, with regard to those who pass through the natural science schools, you said "Only 2 per cent. of those go into agriculture and therefore 98 per cent. are a failure."

15429. If you expend State money for the purpose of instructing people in a business in which they are going to pass their lives, in agriculture, and very few take advantage of it, then I should say that to a certain extent the system is a failure. I do not see how you can draw any other deduction. It is no advantage if the people to whom you give it are not taking it up for the purposes of their profession, but for scientific purposes. I take it the object of the State spending money in agricultural education is to teach those who are intending to take up the particular pursuit for which the education is provided?—It is almost impossible to make any comparison between the state of affairs in this country and the state of affairs in a foreign country. There are two institutions, we may say, which have the same name, both called the Agricultural Institute, one in Belgium and one in England, but that is all we have in common. Their objects and aims, and the type of student that goes to them, are entirely different, and a comparison between an agricultural college in a foreign country and an agricultural college in England is altogether fallacious for that reason; they set about to do something different from what we set about to do.

15430. I find it rather difficult to understand because I took down some of your words. You told us that in Germany it was done through the universities and that the organisation was in the hands of the agricultural societies and that it was tolerably successful, and then you said that in Austria it was not a success, and I under-

stood you to say that was because the land was in the hands of large owners and the conditions different from those in Germany. I may be wrong, but that is what I gathered?—I am sorry if I gave you that impression.

15431. (*By Mr. Medd.*) Is it not the fact that the majority of the students from the highest colleges in England do not become farmers, and that the same remark applies to Grignon and to Beauvais in France?—Nearly 50 per cent. I think.

15432. You think 50 per cent. become farmers?—Those are the figures I have been given; I can verify that.

15433. Your experience is wider than mine, but I should say that neither from Wye nor from a college like Cirencester do anything like half the students become farmers, actual cultivators of the soil—not land agents or teachers, I refer purely to farmers?—May I read this little introductory remark of Prof. Wallace's to the Record of Students who Studied in the Edinburgh University Department of Agriculture? He says: "The majority of students who have come to the class of Agriculture and Rural Economy have been the sons of farmers, and others associated with land, who have studied but for one or two winter sessions and have generally gone back to farm at home under the practical guidance of their fathers."

15434. We were only speaking of England and France. I think the conditions are wholly different in Scotland?—A good many of those students were Englishmen who have gone to Scotland.

15435. (*By Lord Barnard.*) Will the memorandum you are going to hand in include India. Have you any information as to India?—I do not know that we have any information, but we can get it if we have not.

15436. (*By Mr. Medd.*) Have you visited any *écoles pratiques*?—No.

THIRTIETH DAY.

Wednesday, 17th July, 1907.

PRESENT :

The Lord BARNARD (*in the Chair*).

The Lord BELPER.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. T. H. MIDDLETON, Assistant Secretary to the Board of Agriculture and Fisheries, formerly Professor of Agriculture, Cambridge University, examined.

Mr. T. H. Middleton.
17 July, 1907.
15437. (*By Lord Barnard.*) You are now Assistant Secretary of the Board of Agriculture?—I am.

15438. Perhaps you will tell the Committee very shortly what your career has been before you took up that appointment?—From 1889 until 1907, that is until the present year, I have been a teacher of agriculture. I can go a little further back, if you wish.

15439. If you please.—I am the son of a Ross-shire tenant farmer, and was brought up upon a farm. I received my school education in Edinburgh. After leaving school I went almost as a matter of course to a Scotch University. I graduated at the age of 19 and then I went back to farming.

My intention was to farm in Scotland. I had occasion to carry out, in connection with the Highland and Agricultural Society, a number of demonstration plots. I became very much interested in this type of work, and I saw if I was to get any direct advantage from science as a farmer that I must get more first-hand information. I therefore went back to the University of Edinburgh with the object of getting information. I had no intention at the time of taking a prolonged course there, or of graduating. As a matter of fact I did graduate at Edinburgh, but I still intended to become a farmer. I then got an offer of an appointment in India. Curiously enough, this appointment was due to the action of our chairman, Lord

Reay, who was then Governor of Bombay, and who persuaded one of the Indian Colleges to establish an Agricultural Department. After some consideration I decided to go to India, and having taken to a teaching career I continued in the teaching profession. But what I want to emphasise is this, that I studied agricultural science for the sake of acquiring information which I expected would assist me as a farmer. I should like to add that I had a very good general education and scientific education before I had any close connection with farming, but I found that after I had got some practical knowledge of what the farmer wants, when I went back to the University a second time, I learnt more in a month than I learnt in two or three months on the previous occasion. I have always been, therefore, a strong advocate for the study of practice before the completion of the course of theoretical study. I went first of all to India, and organised a department of agriculture in an Indian college, the first of its kind in connection with an Indian university. I was there for six and a half years. I came back as lecturer in agriculture to Aberystwyth, where I was for three years. I went from there to the Armstrong College, then the Durham College of Science, for about three years. I have been in the University of Cambridge for rather more than five years, and recently I came from Cambridge to the Board of Agriculture.

15440. If I may say so, you have really raised yourself to your present position by your own industry and attainments?—Well, I do not know. As a boy I had as good opportunities of getting an education as any boy had. I got the best school education and six years' university education.

15441. Your career illustrates very strongly, in my judgment, the type of student whose future we ought to have very distinctly before us in considering the report we make, and we are very much indebted to you for the information you have given us, and also your own private views that you have expressed on the subject of the training of agricultural teachers?—I might just add one word. I think, perhaps, that I may claim to represent the agricultural student, and I may say that what the agricultural student wants is information on which he can depend, and if we provide the kind of knowledge that the agricultural student asks for and requires, we shall have him coming forward in increasing numbers to acquire this knowledge so that he may utilise it.

15442. Now will you carry that a step further and tell us from your experience of these various colleges to which you have referred, whether you think they are providing the kind of instruction and information which the student wants?—I should prefer not to give evidence on that at the present time. I will do so, perhaps, later on. I intend in my evidence to deal chiefly with two points. First of all I wish to continue what Mr. Rogers was saying and had not time to finish last night about education in other countries, and I also want to say something about the development of the department at Cambridge, as that forms an illustration of a department in our own country. I am sorry that my notes on foreign countries are rather scrappy, as I had not intended to give evidence on this subject. I will take types of agricultural education in some foreign countries which I have seen and of which I have read. First of all take the kingdom of Saxony where I happened to spend a day a fortnight ago. Saxony is, roughly, about the size of Yorkshire, and it has a population dependent upon agriculture, of about 500,000. Yorkshire will have an agricultural population, that is including those actively engaged in agriculture and those dependent upon agriculture of about 300,000, so that Saxony has got a much larger agricultural population than Yorkshire. As a matter of fact, the agricultural population of Saxony is, I think, about twice as dense as that of England and Wales. To provide for this population Saxony has, first of all, the University of Leipsic, with an agricultural department. They have there studying agriculture about 200 students during the winter and 150 during the summer term. The University is one of the largest in Germany. They have also in Saxony a forest school, a veterinary college, and 15 agricultural schools—we should call some of them colleges in this country—of varying grades. I have a list of these here, and if the Committee likes I could get particulars about any of the schools in Saxony. I know which are among the best, and I could get the course of study, programme and so on. Saxony is the richest agricultural country in the German Empire, but it is small as compared with its neighbour—Prussia. Prussia has got an area of

about 2½ times the size of England and Wales and, roughly, the population dependent upon agriculture is from three to four times as great. For this population they have in Prussia five University departments of agriculture, two colleges quite of University rank, two colleges for forestry, two veterinary colleges, and 16 high class—I do not mean high schools, I wish to indicate merely that they are of a high order—agricultural schools called *Landwirtschaftsschulen*. The work done at many of those schools is similar to the work done at some of our agricultural colleges. Then there are 22 lower-grade agricultural schools, 138 winter schools (*Ackerbauschulen* and *Landwirtschaftliche Winterschulen*) and 177 special schools dealing with such subjects as dairying, farriery, horticulture, and domestic economy. I have particulars of all of them in front of me and could get you further information, if required, of what is being done. Now, I will give you an indication of the cost of some of these institutions. Take first a University department like the department at Halle. That, so far as I can make out, costs the Prussian government about £6,000 a year. The number of students is about 300 in the winter term and 250 in the summer term. The other type of important institution in Prussia is the so-called high school or as we should call it, Royal Agricultural College. There are two of these, one at Berlin and the other at Bonn. The Berlin Institution is the finest of its kind in Europe, I think. I have not seen the Institute at Paris, but Berlin is certainly very perfectly equipped for the teaching of agriculture, and is one of, if not the best of its kind. I have got pictures of the Institution which will give you some idea of the type of building. (*Handing volume*.) This institution costs the State something like £27,000 a year, and it receives in fees and from other sources about £9,000 a year. So that the total income is somewhere about £35,000, or £36,000 a year. These illustrations will show you the kind of institutions which exist and the kind of work that is being done in Prussia. What strikes one very much on the Continent is the extent to which not only government but agricultural societies take up agricultural education and research. Agricultural societies not only subsidise experimental stations but they employ teachers, always well qualified teachers sometimes associated with central institutions, sometimes with small local institutions, and sometimes itinerant teachers who go about giving advice to members of the society. I may say that particulars about all these institutions and societies, the names of the men who are employed, and so on, are contained in this little German calendar, so that the information can readily be obtained. (*Handing book*.)*

15443. Is that an official document?—No; it is an ordinary book published in Berlin; I bought this copy when I was there recently.

15444. It is available to the public?—Yes. It is an agricultural pocket book. It is in two parts. The first part the German farmer carries in his pocket. It contains a diary for taking down his notes and it also contains a large number of tables, the same kind of tables as one finds in McConnell's Agricultural Notebook, and the second part he keeps at home as a reference book.

15445. (*By Lord Moreton*.) What does he buy it at?—3½ marks.

15446. For the two parts together?—Yes. Then another point that strikes me in the case of Germany is the very large number of qualified teachers that are available. If you turn up this book and look at the list of those who are engaged in teaching in any of the schools one finds that the director and professors are highly qualified. A professorship in Germany is sometimes a personal distinction and not only for those who are connected with the universities.

15447. (*By Lord Barnard*.) Do you mean that in Germany they do not do as they do in this country, very often assume the title of professor?—I cannot answer that question, but in Germany it is used as a personal title more often than here. In Saxony as in Prussia, you find doctors of philosophy engaged in teaching in the middle and higher class schools.

15448. Are these teachers practical men?—Not in the English sense of the term "practical," but teachers have got to go through a prolonged course and pass an examination, and in Prussia they require at least one year's practical agriculture before they are qualified. This slight sketch of the colleges and schools of these two kingdoms conveys a very inadequate idea of the total amount of agricultural work that is being done there. In addition they have a large number of experimental stations; there

Mr. T. H. Middleton.

17 July, 1907.

* Mentzel und von Lengerke's *Landwirtschaftlicher Hilfs und Schreib-Kalendar*, 1907.

are about 76 altogether in Germany at the present time; in Prussia there are about 46 of these institutions. Saxony has got five, so that a State of the size of Yorkshire has got five of them scattered over it, and some of the Saxon institutions are very noted. Mückern, for example, which is one of the oldest experimental stations in Germany, has done very fine work. Another point, and one which I have already alluded to: I asked when in Berlin which of these experimental stations was best worth visiting, and I was specially recommended to see one in Saxony (I was unfortunately unable to visit it); upon inquiry I learned it was supported not by Government but by a chamber of agriculture. So much for these two countries in North Germany. I will now give you a sketch of the work in America, which is rather different in character, because there have been different problems to face. First of all with regard to the United States.

15448b

Mr. T. H.
Middleton.

17 July, 1907.

15448c

I looked up last night the area, and I find it is about 60 times the size of England and Wales, and the population is roughly twice that of England and Wales. The population dependent on agriculture would appear to be about eight times as great as that of England and Wales. To serve this population they have got first of all a central department of agriculture at Washington, which is partly administrative like our own, but primarily—the word “primarily” is used by one of their own officials in describing it—it exists for the purposes of research. The funds available for this central department are over a million pounds per annum. The divisions of the United States Department of Agriculture are the Weather Bureau, the Department of Animal Industry, the Bureau of Plant Industry, Forest Service, Bureau of Soils, Bureau of Chemistry, Bureau of Statistics, Bureau of Entomology and the Bureau of Biological Survey, the Office of Public Roads, and the Office of Experiment Stations. The Office of Experiment Stations is the department with which we are directly interested, it has charge of educational work and publications. Before I pass to the separate States I may say that this Office of Experiment Stations publishes the most valuable work in the English language on agriculture. This publication (*The Experiment Station Record*) consists of an abstract of all the work on agriculture which has been done in every part of the world. It is published every month. If you want to find out what is being done in any part of the world in agricultural science you turn to the index and you will find a reference. The references are usually a few lines just to show where to find the original article; but when anything important happens they give an article on the subject, so that to keep in touch with agricultural work generally this is the best publication. (*Handing volume.*) My own interest in the *Record* began in India. I used it from the beginning, and I found it was particularly valuable to me in India, because it brought me into contact with the work in the Southern States of America, which, of course, was similar to the work that we had in cotton and tobacco-growing in India. Next with regard to the individual States: each of the American States, with one or two unimportant exceptions, which I need not mention, possesses, at least, two institutions for the promotion of agriculture or agricultural education, one is the Land Grant College and the other is the Experimental Station. First as regards the Land Grant Colleges. These were founded in this way. About the middle of last century there was a movement to secure agricultural education in America—Major Craigie referred to it in his evidence. In 1862 an Act called the Morrill Act was passed, which granted 13,000,000 acres of land to the different States for the purpose of endowing Land Grant Colleges. The grant was made in proportion to the population, 30,000 acres for each senator and member of Congress returned by the different States; and therefore, the older States got the best of it, having at that time the larger population. The States appear to have been given a perfectly free hand in dealing with this land, and some of them having sold the land have made particularly good use of the funds. Others have not done so well, and there is a very great difference now in the income which the colleges derive from the grants of land originally made in 1862. One stipulation was that no part of that money was to be used for building. In 1890 there was a second Act passed, which secured to each Land Grant College a sum of 15,000 dollars at that time, rising to 25,000 dollars, which is now the amount paid to each. The value of the foundation of the 63 Land Grant Colleges of the United States is at present between £200,000 and £300,000. That is the average capital value of the institutions, the buildings, and all they possess. The average annual income of the Land Grant Colleges is about £30,000, so far as I can ascertain. These Land Grant Colleges are not at all meant to be exclusively agricultural.

The leading object of the Land Grant College was to teach such branches of learning as are related to agriculture, and the mechanical arts; engineering, &c., therefore come in. The idea was to make them useful as professional colleges for the people of the United States, and also, I may say, the grant having been made during the Civil War, a point was made of military instruction, and I think all of them give military instruction. The great majority of the students in the Land Grant Colleges do not, as a matter of fact, study agriculture. We can ascertain to what extent the Land Grant Colleges are used by the agricultural population in this way. In 1904 there were 2,700 teachers in these colleges, and 56,000 students. Of the students, 5,000 only were taking a four-years' course in agriculture, while about 6,000 were taking shorter courses. The short courses in the United States are a good deal longer than our short courses. They are about 26 weeks at Cornell, but they vary at different places. I can give particulars about the short courses if necessary. With regard to the objects of the agricultural college I should like to just quote a sentence, which I made a note of in this connection: “At present there is little demand for the all-round expert in America. Few colleges attempt to educate them.” (That is the agricultural expert.) “Such an expert cannot be educated in four years, if at all. When the demand arises for this type, training will have to begin in the preparatory school, and continue till the end of the university course; but the demand is far off. At present the colleges content themselves with giving the students a fair general knowledge of the sciences underlying agriculture, horticulture, and the animal industry, with opportunities to acquire experience in some one line of practical work.” That is to say, the American colleges from the beginning have recognised the fact that the whole subject agriculture is too wide a subject for one man. The students have to specialise from the beginning in animal industry, or plant husbandry, or some other department of agriculture or horticulture, and such a type as the County Council “instructor” does not exist in the United States. I do not mean the actual agricultural expert of the County Council, but the agricultural expert the County Council expect to get when they advertise for a man to act as an instructor. In addition to these Land Grant Colleges, which are used by the agricultural student, we have the Experiment Stations, which are meant for the acquiring of agricultural information; and, looking at the question as an outsider, it seems to me that the university and college education of the United States have only become successful since these experiment stations began their work, and since the results of the work permeated the colleges. I notice a very great difference in the quality of the work which one comes across now as compared with what one saw, for example, in 1888 and 1889.

15448e

15448f

I will now give you a brief outline of the work of the experiment stations.

15449. When were the experiment stations established? —At different times. The first station began in 1858, but it had to be abandoned during the Civil War. In 1871 there was another station established, and between that time and 1887 there were founded in the United States 17 different stations, but they were all crippled for lack of funds, and they were not able to do very much. It was not until the passing of what is called the Hatch Act that these experiment stations really began vigorous and useful work. The Hatch Act was passed in the year 1887, and that Act provided that each State should have 15,000 dollars from the Federal Government for the purposes of the station. The Adams Act of 1906 will ultimately provide a further sum of 15,000 dollars for each. The State Governments supplement the central contribution, and at the present time the average income of the American experiment stations is between £6,000 and £7,000, more than half of which comes from the Federal Government at Washington. These experiment stations differ greatly in size and wealth; some of them are very wealthy. Some States give large contributions, and in other cases the individual State gives a comparatively small amount. When the Hatch Act was passed each experiment station was laid under an obligation to provide a bulletin once every three months. That is the only part of the law as to the wisdom of which I have some doubt. The result certainly was the publication in the early years of a great deal of material which should not have been published. It may have had a good result, and probably had a good result in stimulating workers and making them reduce their work to writing; but it was unfortunate for the good name of the experiment stations themselves that they were bound down to this regular publication of reports. There exists in the United States a powerful association

15449a

15449b

of teachers, and others associated with American colleges, schools and experiment stations. This association has been largely instrumental in improving the character of the courses of agriculture at the different colleges, and, through their annual meetings, in improving the quality of the work which is done at the experimental stations. The reports of the meetings of this association are most

15449c interesting. I can hand round reports showing you the kind of work that is done at the experiment stations, and if you will glance through these publications the photographs will give you a fair illustration of the type of buildings which they employ. There is a table at the end of one pamphlet which shows the incomes and the line of work of each station. Then as a specimen of the kind of bulletin which is published for farmers, I picked out last night at random one on the principles of horse breeding which I will hand to Mr. Latham. It is a Wisconsin bulletin. (Handing document.) The United States Government are always having special reports prepared, and the Office of Experiment Stations issues, in addition to the *Experiment Station Record*, a very large number of special reports. Here is one for example which deals with agricultural instruction for adults in the British Empire. That is rather interesting to us. It consists of 96 pages, and it does not get down to Great Britain until the 65th page. They find more to record in the Colonies than they find in Great Britain apparently. I have not read this report through, however. (Handing document.) Then here is a report which would be of interest to some members of the Committee, showing the kind of instruction in agriculture which is given at the American colleges, and also one containing reports on short courses. (Handing documents.)

15449d I should like to add to the information which I have given about the work in Germany, one point that I omitted to note. Nearly all agricultural institutions in Germany are connected with the different kingdoms or states. But there is one institution at least for the whole German Empire which is of the greatest importance to agriculturists and that is a new institute established in Berlin for the purpose of investigating the diseases of agricultural and forest crops. This institute is at Dahlem; it is very well equipped; it has got a large staff, and the whole object is to work for the agriculturists of the Empire. We might compare the work done there for agriculture with the work the physician does for the human species. They issue leaflets as our Board does. I have specimens of their reports and also of their leaflets here. I visited that institution, and I could give more information to any member of the Committee who would like to hear about it. There was another point that interested me at the University of Leipsic. I have their time table here, and I find the students begin their work at seven in the morning; this is a point that is rather significant. They seem to work very long hours at these institutions.

15449g 15450. At what ages do these students go?—They are very variable in age just as in this country, but I should say 19, 20 and 21 is the ordinary age of entrance and in Germany they like all agricultural students to know something about farming before they come to the institutions, so far as I could gather in conversation with the heads of the departments this preference is widespread. Recently I have also seen institutions in Austria and in Hungary, but I do not think I need refer to them now. I have not had an opportunity of going into their work fully.

Now with your permission I should like to say something about the work we have been doing at Cambridge.

15451. Before you deal with that can you give the Committee any information about India?—In a general way I know what is being done in India. India has got a central institution for research at Pusa. Government aims at having at least one agricultural college in each province, and also one agriculturist, who shall act as a deputy director of agriculture and look after agricultural matters, an agricultural botanist, a chemist and a mycologist. They want these men in each province; and they are appointing them as fast as they can get them.

15452. Is the subject progressive in India?—They have made very great progress in the last 10 years. There was nothing of the kind in a University college when I went out. There was an agricultural college at Saidapet, near Madras, but it was not connected with the University there.

15453. We may assume that the British Government, then, are satisfied as to the necessity of the work?—Yes, very decidedly so.

15454. I suppose we need hardly ask, these institutions are more or less Government institutions?—Yes. At Pusa, the Imperial Institution, and the provincial institutions in Bombay, Madras and the United Provinces are all Government institutions.

15455. And paid for by the Government?—Yes. There has recently been founded an important institution for research endowed by a Parsee, Mr. J. N. Tata; I think it is located in Bombay. It is the only research institution that I can call to mind in India which is not Government. There are educational institutions which are not supported by Government and a certain amount of scientific work is being done in some of these institutions, botanical and chemical, but not agricultural.

15456. (By Mr. Medd.) Are you familiar with the reports which have been issued by M. Orange?—No. I know of them, but I have not read them.

15457. You would see from them that agricultural teaching has become universal in all the elementary schools. They have not got so far as that in France, but it is stated in the syllabus that agricultural teaching shall be given?—Shall be given; I cannot say that it is being given yet; I think not.

15458. This Report was only issued 18 months ago?—Quite so. I know they aim at that, but it will take some time before it is accomplished.

Lord Reay asked me to say something about the Cambridge course of study after Professor Wood gave evidence. I was supposed to follow on at the time and to have supplemented his evidence, but there has not been an opportunity for me to do so until now. I will continue where Mr. Wood broke off. I shall give a considerable number of facts in connection with the Cambridge course because I think it is useful for us to have the facts in evidence to show what has been done there. We have at Cambridge a technical course of study preparing for the University diploma in Agriculture. The normal length of this course is two years, but the diploma can only be taken in this time by a student who has had some preliminary scientific training. As a matter of fact, students usually spend three to four years at the University before going up for the diploma, and we always try to make them take a degree first. This year, for example, 18 students appeared for the agricultural diploma.

Of these, nine held a Cambridge honours degree (three, I think, first-class), five held the Cambridge pass degree, one was a graduate and scholar of Bombay University. One intends to graduate, he has not yet done so, but I have no doubt he will take an honours degree, and one of these candidates was not a Cambridge student. We had 18 candidates, but only one from another institution. I may say that represents the ordinary course of events. We have very few students coming from other institutions; although the diploma is open, the number of candidates is small. Of the 18 students, 14 passed and 4 failed. Then, with regard to the time which they had spent in study, 13 of the Cambridge students had been four years or more at the University, two had been three years, two had been two years only, but one of these was the Bombay scholar, who was a distinguished student of Bombay University. I may say in passing that we have a large connection with India; we always have several Government scholars, and one of the men who took the diploma this time was an Indian civilian, a Cambridge graduate, who has been in the Indian Civil Service for eight years, and was home on furlough. Next, with regard to the total number of students. We had 51 students on the books last year. Of these, 23 were studying for professional purposes, that is to say, in connection with either teaching, or other agricultural posts. 17 of these were graduates, two had already qualified for graduation, had not kept the terms, but had qualified; three others were preparing to graduate. 19 others were interested in agriculture as landowners or prospective farmers. One of these is a landowner who has taken an honours degree and is now doing some research work. I know of one who will become a land agent. I could give you the details about all of them, they are all connected with land. With the remaining nine I am not, personally, acquainted, and I cannot tell you what they are going to do, but one of them at least was a Japanese student of Economics. I may say that certain of the students of Economics are recommended to attend the lectures in agriculture, and there are always one or two who come. Of the 51 students two only were county students. Both these come from the county of Essex with scholarships and were ordinary members of the University. I may add that there was a third county student who had passed through our course and is qualifying to graduate now, and there may have been some others of whom I have not heard, but the total number of county students coming up is always small. We do not recommend any county to send up a student who is not well qualified to take advantage of the course or who is not up to what we call honours standard. The chief thing that one notices about the Cambridge course, looking back

Mr. T. H. Middleton.

17 July, 1907.

15452a

15452b

15458c

Mr. T. H.
Middleton.
—
17 July, 1907.

15458d upon it, is that we have had a very great change in the quality of the students since the University Department was founded. At first there was a disposition not to take agriculture seriously. Professor Somerville, speaking about Oxford, said that they did not desire an honours degree in agriculture; they want all men who take to agriculture as a serious study to obtain an honours degree first. That is precisely the position in Cambridge. They must at least take honours, if they intend going in for the teaching of the subject. We have a farm at Cambridge of about 140 acres, which we find of the very greatest use to us for the following purposes: First, we employ it to demonstrate to students. Some of them, I am sorry to say, get their first lessons in agriculture there. We do not like that, but sometimes we have got to use the farm for this purpose, but we do not profess to give full instruction in practical agriculture on the farm. We advise students to go to a practical farmer during the vacations, and before they come to us, or after they leave us, if they have not had sufficient practice beforehand. During the 24 weeks of term there is no time to give much practical instruction in agriculture. What we do is this: we use our own farm for demonstration purposes to let students see what is being done at each season of the year, so as to let them get familiar with the crops and the ordinary routine. Supposing I were beginning a class in the winter, after having taken students two or three times to our own farm until they have got a general idea of the character of the farm and the subjects that we are going to study, I take them to see other farms in the neighbourhood and we go round to see the things that we are speaking of in the class. If, for example, we are dealing with the subject of soils, then they go round and see all the soils in the neighbourhood; and if it is crops or live stock, then they see the crops and the live stock, both on our farm and elsewhere. That is all the practical work we can do during our 24 weeks of term in a University course. We try to get these excursions once or twice a week, but it very much depends on the weather as much of the work is done on bicycles. Then we use the farm for demonstrating to farmers, and these demonstrations we find most useful. It is by means of them that we have got into close contact with the farmers in the Eastern Counties. They come there in large numbers now. Last year we had about 600, and we could easily have had more if we could have taken them. When farmers come they see what is being done, and as our system is that each person is responsible for some particular work, each one is a specialist in some particular business. The farmer finds that there is someone on the farm who knows about some one part of agriculture more than he does himself, and many farmers come there to learn. They are particularly interested in wheat breeding and also in potato experiments. Wheat and potatoes are important crops in our own Cambridge neighbourhood. It is very easy to demonstrate things with these two crops which will give farmers an interest in the work that we are doing.

15459a 15459. (By Mr. Staveley-Hill.) Do you mean you would have had more than 600 if you had had room?—Yes, if we could have arranged to take them, but there is a difficulty in fitting in the days. Farmers come at a time when the crops are nearly ripe, before harvest, and there is a difficulty in getting the days to suit large parties. Last year, I remember, I had 113 to deal with on one day, and as we cannot take more than 40 round at a time, we began at 10 in the morning taking parties in relays, and went on until 7 at night. The parties have got to be organised; we have to make arrangements, and we do not invite more than we can fit in. We make a point, in connection with our experiments, of continuing the same work year after year so that we can give definite information on any particular point that is asked in connection with the crops that farmers see there. If they ask about a particular potato we can tell them all about that particular kind of potato so far as Cambridge neighbourhood is concerned, and if they ask about a particular kind of oat we can tell them all about that. We can tell them all about it because we have had its history for some years, and the same is the case with regard to mangolds. That is what farmers like; they want definite information upon points they are interested in. The chief purpose of the farm is to enable us to carry on research work; we could not get on without a place of this sort on which to carry on breeding experiments, and also the tests I have just alluded to which give us information. And I may add that a farm is an absolute necessity to any institution which is teaching agriculture, because if the institution has not got a farm, the teacher of agriculture gets stale; he gets out of practice, and the teacher of agriculture must be in close touch with farming. It is one of the chief arguments for the

association of a farm with an agricultural institution that you must keep the teachers practical. Then a word about the cost of an institution of this sort. We were allowed £200 from the Board of Agriculture for the expenses of this farm, and our own Board in Cambridge allowed £100 a year. We were allowed to spend £300; as a matter of fact, we have spent on an average £275, that is to say, we lived well within our income. We did not attempt to make a profit; if there is any money in hand we use it for what we think will be an interesting demonstration, or for improving the stock, or something of that sort. Then with regard to the individual crops, we keep records of cost, and these crops pay us very well. I have these records here, the cultivation sheets showing what they cost, and what returns we have got. In addition to the experimental work at the farm, we have experimental work going on in the counties with which we are associated. I need not describe it, because you have heard so much of that type of work, but I may say that the area which we use in the counties is roughly the same as the area of the farm, about 150 acres. About 50 to 60 acres we hire for the purpose of experiments. Most of it we get lent to us, or sometimes the County Councils hire it for experiments. There is no difficulty at all in the Eastern Counties in getting suitable land for temporary experiments. There is a difficulty, however, in getting land for permanent experiments, where, of course, one would cause a great deal of trouble to the land owner or the farmer. The chief object in these experiments is to obtain information and materials for research for the benefit of agriculturists of the district. We use local plots as feeders for the farm and they keep us in touch right round. I would like also to emphasize the advantages of the association of the Department with the University. Mr. Wood referred to the fact that we had a large supply of students to draw upon. That is obvious, but from my point of view, having gone there from the outside as a teacher, having lived there and now looking back upon my experience, I feel that the University was of great value to me, because I was in a position in which I could get advice on any subject on which I required advice. We could indeed always get advice and assistance for the asking. If there was any chemical point of special difficulty, for example, that Professor Wood could not deal with himself, he could go to a chemist who has made a speciality of that particular point and get information and help. Mr. Biffen in the same way would go to some man who had made a special study of a particular subject if he wanted further information with regard to a problem. This interchange of information is going on continually, and it is this, I think, that has enabled us to get done in a comparatively short time a relatively large volume of research work. The opportunity of going whenever you are in difficulty with any problem to someone who is likely to know more about it than anyone else in the country, and getting his advice, is of the very greatest value. Then I should like to say, while I am talking about the advice and assistance which we have got from others at Cambridge, that we are also, as a department, very much indebted to the University Authorities, who have greatly assisted us in general administration and in the arrangement of our work. We have no buildings; that is our chief difficulty at present. We have been borrowing buildings from professors or from colleges for the last five or six years, and the professor who has been most generous to us in the past, Professor Liveing, now requires all the room that we occupy, in fact he has had to arrange for an addition to his laboratory. He is retiring, and I have no doubt we shall be turned out of our room within the next year or two. In view of this, knowing what was in front of us, we set about collecting funds for a building and I am glad to say that the Chancellor, the Duke of Devonshire, has taken the greatest interest in the subject; he practically has himself taken charge of this fund, and we now have between £12,000 and £13,000 in hand for the erection of a School of Agriculture.

15460. (By Lord Barnard.) Is that in connection with the general funds for extending the University of Cambridge?—It is part of the same fund. There is an Association called the University Association of which the Duke is President as Chancellor, and that Association has a number of branches, each branch being engaged in raising funds for a particular object. Our branch raises funds for agriculture. We are now in a position in which we are ready to build; we have obtained a site from the University, and within the next two or three years I expect to see a good School of Agriculture erected in the University, which, of course, will make a permanent centre for research and educational work.

I would also like to refer to a subject not connected with the University, but which is connected with agricultural

15460b education. Some of us felt that teachers of agriculture suffered because there was no one journal which was devoted exclusively to the publication of the results of original work in agriculture. The papers which were written were sent to journals dealing with chemistry or botany and were apt not to reach agriculturists; we therefore established a journal. We approached the Syndics of the University Press and asked them to take the journal up, and they kindly agreed to do so. There was a private arrangement by which we guaranteed a sum of money against loss. The first volume of the *Journal* is completed; the second volume is in process of publication. I should like to hand the first volume round so that you may see the steps that we have taken in this respect in the interests of agricultural education. (*Handing volume.*) The requirement for everything published in the *Journal* is that it must be original, and it must, of course, show good work.

15460c One other subject I wish to bring before you is the Agricultural Educational Association, which has been mentioned once or twice. I was at one time the chairman of a sub-committee of that Association, but I am now an ordinary member, and I can perhaps speak more freely on the subject than Mr. Brooke-Hunt, who is chairman. That Association exists for the same purpose as the American Association, namely, for enabling teachers to interchange ideas, so that each may know what the other is doing. I may say that the Association has been of great value to me personally, and I have no doubt to a good many other teachers. It is of great importance for teachers to be able to meet once or twice a year, to learn the experience of others, and to discuss the directions in which the work may be furthered. The particular lines in which good work has been done are precisely the lines along which we have had an indication that good work is required: this Association has done a good deal in co-ordinating the work of the colleges. We all of us felt that the local experiments required co-ordinating, and we prepared, and had published by the Board of Agriculture, a set of schemes which were meant to be example schemes for the different members of the Association. That has done a great deal to improve agricultural experiments in the country. The same might be said about our teaching. I think we have all got hints for our teaching from that Association. Professor Campbell alluded to the Association and mentioned the great trouble in connection with it, viz., the difficulty of getting men who are widely scattered to meet so often as twice a year for purposes of conference and discussion. I think it is worth the consideration of the Committee as to whether some means could not be devised in order that we might make more use of an Association of this type, as a means for getting still greater co-ordination and co-operation in agricultural work. That certainly is the way in which similar work has developed in the United States of America.

15460d 15461. You have given your information so clearly that I hardly think I have any questions to ask you. There is just one point with regard to Cambridge. How far, if at all, do you influence secondary schools or advise them?—We do not do so except by meeting privately those who are interested in secondary schools. We have no direct connection with the secondary schools, not as a department, that is to say. The University influences secondary schools very largely through the local examinations. Members of our department share in examining.

—15462. The great object of the department at Cambridge, I gather, is to add to the general stock of scientific knowledge on agricultural matters?—Yes, and to provide teachers; but these teachers, at present, are going to India and to other countries.

15463. I do not know whether you care to answer the question or not, but I should like to ask you whether in the terms of reference to this Committee, you consider that the Cambridge arrangements for agricultural education are sufficient and satisfactory?—I would prefer not to express an opinion just now; I would rather do that as a member of the Committee.

15464. (*By Lord Moreton.*) You mentioned the veterinary colleges in Germany, they are integral parts of the University, are they not?—I do not know of any veterinary college which is a part of a University. I am not sure about the one at Dresden, but the one at Berlin is a separate institution, just like the agricultural college.

15465. Are those veterinary colleges maintained with the object of teaching veterinary science or are they maintained with the object of producing or training veterinary surgeons for the Army?—For both purposes.

15466. Can you tell me what sort of grants the government give those veterinary colleges?—With regard to

the High School at Berlin the State supplement in 1905 was 243,000 marks, about £12,000.

15467. The cost of that institution alone to the State is £12,000?—Yes. The grant from the State was 243,000 marks.

15468. How are the results of the American research work made known to the farmers? Are there any cheap publications in America like our Board of Agriculture leaflets?—Yes; there is an admirable series of Farmers' Bulletins, which are fuller than our leaflets are. They are small pamphlets of usually from 10 to 20 pages.

15469. Published at a very moderate cost and very largely circulated?—Yes; I think they are circulated very largely.

15470. (*By Mr. Medd.*) Perhaps I might be allowed to mention here that in 1904, 12,421,386 copies of those were distributed?—They are very largely distributed.

15471. (*By Mr. Latham.*) Is the book on horse-breeding that you handed to me a private book or an official publication?—That is published by Wisconsin Experiment Station as a bulletin, and is sent to every farmer in Wisconsin, I suppose.

15472. I strongly recommend that something of the kind should come from our Government. If it is a book that is officially sent out, it is really a very valuable book?—Yes.

15473. (*By Mr. Davies.*) In the United States, does the Government try to get at the farmer directly or does it get at him through the colleges and the local agricultural institutions round the country?—Chiefly through the colleges and local institutions, I believe. Farmers' Institutes now are doing a great deal in getting at the farmer.

15474. How about the distribution of literature?—Each State distributes to its own farmers. I am not sure to what extent the Central Government at Washington sends publications to the farmers. I think it would very much depend upon the character of the farmer. I should think important farmers would be likely to get all the publications, but I have no knowledge of that. Those who live in the State get the State publications direct from the State.

15475. That is the method which the Board of Agriculture here have also adopted?—Yes. We send our leaflets out free, but our *Journal* is only sent to those who subscribe; it costs 4s. a year.

15476. You do not think it would be a better system if the Board tried to reach the agriculturists of the country through the already existing local agricultural institutions?—We do so in this country so far as possible; we try to reach them by every means in our power.

15477. I am thinking of the leaflets, the distribution of literature which goes direct?—I am afraid at present the colleges have no means of distributing leaflets cheaply. The Board can frank them and, so far as the leaflets are concerned, it would be more convenient that they should be sent out from the central Department, because England and Wales correspond to one State of the United States so far as size goes.

15478. (*By Mr. Medd.*) You mentioned Scotland at the beginning of your evidence. Do you happen to have been educated at one of the Dick schools?—No, I was at a school called Merchiston; I have no personal knowledge of the Dick schools.

15479. The Dick Schools are in Aberdeenshire and Banffshire?—Yes.

15480. I wished an opinion from you as to the value of such schools generally, and as to their adaptability to England. In regard to Germany, did you not find that the German Government clearly differentiates between each type of agricultural student, that a school is of a defined grade?—That is true.

15481. So that a man inquiring for a particular grade of institution, such as Berlin or Leipsic or Dresden, would be referred to a definite place?—Of course I cannot say whether that is the practice, because I have no personal knowledge of what the German Government would do, but from what I know of Germany, I should suppose that that is likely to be the case.

15482. You are not here representing the Board of Agriculture at all?—No, I am giving evidence in a personal capacity.

15483. Do you think in England it would be an advantage to have a clear classification of the different grades

Mr. T. H. Middleton.

17 July, 1907.

Mr T. H. Middleton. of institution as to the type of instruction they offer ?—I see no objection at all to a classification.

17 July, 1907. 15484. Classification eliminates confusion to some extent, does it not ?—Yes.

15485. The more you eliminate confusion in the choice of a school the better ?—Yes ; but, of course, before one makes up one's mind to any system of classification, one has got to have the particular institutions to be classified in one's view.

15486. Of course you are more familiar than I can possibly be with the institutions in existence, but I, as one of the public, am perfectly aware that there is the greatest confusion existing as to the grade and quality of the instruction offered by these different institutions and I ask you, merely as one of the public, whether you do not think it would be to the advantage of the public to have a clear distinction and definition and classification of institutions ?—We try to make known, as far as we can, what the character is of the education that is offered at each institution.

15487. Are you speaking now of the Board of Agriculture ?—Yes.

15488. I ask you as a private member of the public. In Germany, you say, they do classify them ?—I meant in this : you classify the University departments and the technical high schools in one group, and then you have a group of agricultural schools, then a group of lower agricultural schools and finally a group of special schools.

15489. Exactly ; so that you do know in choosing your type of school " I am going to a school of an intermediate type where I shall become an actual cultivator of the soil," or " I am going to a school of the higher type where I shall become probably an agricultural man of research or a teacher," and so forth ?—I might point out that among the schools in any particular group there must of course be a great number of grades. Some of these agricultural schools are of a very high character and others are of a lower grade. That depends on the staff of teachers who happen to be there at the time, and I do not think one could decide what was the best institution for a particular pupil until one knew the teachers who were there and especially who the head of the institution was.

15490. That is quite true, but in England you would put roughly Harper-Adams on the same footing as Leeds ?—I do not think so.

15491. However, the point is not worth pursuing. Have you visited Holland at all ?—No, I have only passed through Holland.

15492. You have no knowledge of its agricultural system ?—No.

15493. Nor of France ?—No, not except from reading.

15494. Have you visited these American colleges to which you refer ?—No, I am sorry to say I have never been in America.

15495. Of course, then, you are not capable of expressing any opinion as to the type of institution there that you prefer. You referred to the Morrell and Hatch Acts of which everyone knows, and the Land Grant Colleges, but you did not refer to the grades and different types of the colleges ?—I have not personally been able to make a selection, but from the work turned out I know quite well which institutions do good work.

15496. Do you know the type of the college in Iowa ?—I know it, but I do not want to go into the merits of special institutions.

15497. You know they totally differ in character ?—They do.

15498. In regard to the farmers' institutes, have you ever had any practical evidence of their benefit ?—Only from what I have heard from men whom I have met.

15499. Probably agricultural teachers, and so on ?—Yes, and from what I have read I may say that Dr. True has a very high opinion of these institutes.

15500. Dr. A. C. True at Washington ?—Yes.

15501. I know him well.—He has a very high opinion of these farmers' institutes.

15502. He thinks they do good. With regard to the boys' agricultural clubs, have you had any information of them brought to you ?—No. I think there is one in connection with Cornell.

15503. No, they are all over. They began in Illinois ?—I have heard about them incidentally, but I have not followed their development.

15504. Now, with reference to the Hatch Act, what is your impression of its working, taking the States as a whole ?—Taking the States as a whole my impression is that the work of these experimental stations has done a very great deal for the agricultural industry.

15505. Are you aware that the manner in which the advantages offered by the Hatch Acts is taken up in different States varies very considerably ?—Yes, I know that.

15506. I think I had the pleasure of meeting you at Cambridge when I went to visit the Cambridge County School ?—Yes.

15507. Do you think that that school is, from an agricultural point of view, a success ?—I have not closely examined the working of that school.

15508. I think you may remember that on that occasion you most kindly accompanied me to the school, and we found about six pupils on the agricultural side, did we not ?—I might point out that the object is to give a modern training, or a general science training, to the sons of Cambridge farmers, among others.

15509. I think the idea is excellent, but is it a success ? That is the point one wants to ascertain ?—It depends on the point of view. If you mean does it have many students studying agriculture, then I should think, from that point of view, it is not a success.

15510. I think you will agree with me probably in this, that the attempt to combine anything in the nature of technical agricultural instruction with secondary education is a mistake ?—Yes, in general I may say that I do not approve of the attempt to combine what you call technical agriculture or practical agriculture with secondary teaching.

15511. I am distinguishing, of course, technical instruction from educational ?—With respect to this particular school I have never examined it as an examiner, and I am not sufficiently familiar with the work of the boys to pass an opinion as to the educational value of the course. I believe it to be good.

15512. Am I not right in believing that the farmers of Cambridgeshire generally, were consulted by circular as to the type of school they would like to have established ?—I believe they were.

15513. That, you will agree with me, is an excellent thing for a county council to adopt ?—Yes.

15514. (*By Lord Barnard.*) One more word about America. Should I be right in thinking that the agricultural industry in America differs very widely from that in this country in consequence of the fact that in this country it is a well established and organised industry to a certain extent carried on by men with hereditary knowledge and instincts, whereas in America it has very largely to be created ?—That is so, my lord. The agriculturists of America had much more to learn 50 years ago than the agriculturists of Great Britain had. In connection with the present attitude of the American farmer to education I might read one sentence which I noted as being the opinion of Dr. A. C. True, who is in close touch with American experimental work and also with farmers. He refers to the effects of the system of instruction which is now adopted throughout the United States, and he says : " Under these influences, farming in the United States of America is becoming a profession enlisting as high talent, and held in as high esteem as the learned professions." It appears to me that the American farmer may have made up much of the leeway that existed 50 years ago.

Mr. A. E. BROOKE-HUNT, called and examined.

15515. (*By Lord Barnard.*) You at present hold the office of a Superintending Inspector of the Board of Agriculture and Fisheries?—I do, my lord.

15516. You have held that appointment since the year 1888?—I was first appointed as an inspector in 1888.

15517. I think the Committee would like you, if you would be kind enough to do so, to do as Professor Middleton did and tell us what your qualifications were?—I was brought up in the country, and exceedingly fond of country life, and, after taking my degree at Cambridge, I attended at the Royal Agricultural College at Cirencester, intending then to take up land agency. I obtained my diploma there at the end of the course, and also the diploma of the Royal Agricultural Society of England, and that of the Highland and Agricultural Society of Scotland.

15518. Am I right in thinking that in the Royal Agricultural Society's examination you took first place in your year?—Yes, I did, as a matter of fact.

15519. The work carried on by the Board of Agriculture is based upon Sub-section 2 of Section 2 of the Act of 1889, which created the Board?—That is so.

15520. That section I see compels the Board to undertake the collection and preparation of statistics, and it empowers the Board to undertake the inspection of, and reporting on, schools, and of aiding schools, and aiding systems of lectures, or instruction, and the inspecting of, and reporting on examinations; that is to say, four distinct topics?—Yes; that, of course, is with regard to schools which are not public elementary schools.

15521. Yes. The Board, through you, do inspect and report upon schools, and they also, acting on information given, to a large extent by you, aid schools?—Yes, using the word "schools" as embracing institutions of every character, even universities.

15522. The Board do not aid systems of lectures, or instruction, do they?—At the present time, not.

15523. Have they ever done so?—They used to do so in the past when the work first began.

15524. Perhaps you will explain later why that was discontinued?—Yes.

15525. Do the Board inspect and report upon examinations?—The necessity does not often arise, but, if it were to, the Board would be quite willing to carry out the work, and in any case they keep themselves entirely in touch with examinations. A short time ago, however, they sent an inspector down to inspect and report on the last examination for the National Diploma in Dairying, and he was practically present during the whole of those examinations.

15526. Lord Moreton reminds me that your Board are represented on the Examination Board for the National Diploma in Agriculture?—They are.

15527. You were good enough to place in my hands some little time ago a very interesting Memorandum, "A survey of the growth of Agricultural Education in Great Britain by means of State assistance," but as Major Craigie has practically covered the ground I do not propose to ask you to go over the whole of it again unless there is anything you wish to draw attention to specially?—I should like to mention the question of grants given by the Board to which you referred just now. Grants in aid of agricultural education date from the time of the Agricultural Department of the Privy Council before the Board of Agriculture was, in fact, formed, and were the direct result of the recommendations of what is known as the Paget Committee which was appointed in 1887. In the year 1888, when it came to a question of seeing what institutions were capable and fit to receive grants, it was found, as a matter of fact, that there were very few permanent institutions, and those only carrying on the work of dairying, which were, with the exception of the University College of Bangor in North Wales, capable of receiving grants. There was, however, a good deal of work both in the direction of dairy lectures, dairy classes, and agricultural lectures, together with field experiments, being carried on by local and national agricultural societies, like the Bath and West of England Society, and other bodies, and it was the practice of the Board in those days to make grants in respect of work of that character. You will see from the Reports, here, on the distribution of grants, which I have from the year 1888 up to the present time, that there were certain classes of instruction carried on at first which were directly aided by the Board, but when the Customs and Excise Act, 1890, was passed, it was

thought that such work, when carried on by purely local means, was work which came more under the duties of the County Councils than directly under the Board of Agriculture. As a consequence, the Board itself began to concentrate its grants more upon permanent centres, or institutions, through which the work was carried out in a group of counties.

15528. In 1887 the Paget Committee made certain recommendations which are before us. We have their Reports, and I need not take you through them. The result of that Committee's recommendations was that the Government Department then charged with the supervision of all matters relating to agriculture, that is to say, the Agricultural Department of the Privy Council, undertook to get from the Treasury, or did get from the Treasury, a sum of £5,000 to expend in grants?—That is so.

15529. Then in 1888 two inspectors were appointed for England, and one for Scotland?—Yes; three inspectors altogether.

15530. We may dismiss Scotland at once from our consideration, I suppose, because all the work in Scotland is conducted through the Scotch Education Department?—It is now, but at first it was carried out by the Privy Council and then afterwards by the Board of Agriculture.

15531. Do I understand there are two inspectors now, yourself and an assistant?—Yes, I have an assistant.

15532. In 1889 the work of the Agricultural Department of the Privy Council was transferred to the Board of Agriculture under the Act of 1889?—That is so.

15533. About that time, I presume, there was a stage of transition and reorganisation?—No, because the policy was perfectly continuous, and the work followed the lines previously adopted by the Privy Council.

15534. I suppose that the complete organisation of the Board was naturally gradual?—Yes, but from the very first, after the Board was appointed, Education received a very large share of their attention, and a director of three Divisions of the Board, the Statistical, Educational and Intelligence Divisions, was appointed, through whom the whole of the educational work, of course, passed. That appointment of director was subsequently merged in that of assistant secretary, as it is existing at the present time. The duties of the Educational Section of the Board are officially described as follows:—"Business and correspondence connected with the administration and allocation of the Parliamentary Grant for agricultural education in England and Wales. Preparation of an annual report to Parliament on the distribution of grants for agricultural education, and on the work carried out by institutions aided by the Board. Inspection of and reporting on educational institutions or other bodies (other than elementary schools) who seek the financial assistance of the Board in respect of the technical instruction in agriculture or forestry. Compiling and publishing summaries of reports on agricultural experiments conducted by bodies who are aided by grants. Conferring with County Councils and local bodies respecting their schemes of agricultural education, advising them thereon, inspecting the work when in operation, and reporting thereon."

15535. That is practically very much what Mr. Macdonald, from Scotland, described in two words as "stimulating and directing" education?—That is the case.

15536. May we take it that to a very large extent the institutions which exist at the present day owe their existence to such stimulation and direction of the Board?—I hope, generally speaking, that this is the case. They owe their initiation to local desire and local effort, but the Board have endeavoured to assist that local effort and to stimulate it as far as possible.

15537. Will you tell us how your clerical work is done?—That is all done in the Intelligence Branch, the head of which you had before you yesterday.

15538. It must be very considerable?—It is fairly considerable. Of course the whole of the strictly official correspondence is carried on in the usual way through the assistant secretary; but there is, in addition, a considerable amount of general or semi-official correspondence which has to be carried on, and this is done by myself personally.

15539. Do you write official letters yourself or do you sign them?—The strictly official letters are signed by the secretary or an assistant secretary.

15540. Are you under the secretary of the Board or

Mr. A. E.
Brooke-Hunt.

17 July, 1907.

Mr. A. E. Brooke Hunt. under the assistant secretary?—My work comes first of all under the assistant secretary.

17 July, 1907. 15541. Can you say at all how much of your time, relatively, is occupied in the office and how much outside?—It is difficult to say, but I should think, roughly speaking, about half and half.

15542. Now to come to questions of policy, will you tell us first what the policy of the Privy Council was as carried out by their Agricultural Department?—Of course the whole question of agricultural education as fostered and assisted by the State was perfectly new in this country at that time, and with the concurrence, I believe, of the Treasury, the policy of the Agricultural Department of the Privy Council was at first very tentative, and was framed with a view of ascertaining the extent of the demand there was for this class of work and of indicating the direction in which further assistance could be afforded. It was so tentative, I may say, that for many years it was a regular rule for the Department to write to each institution, when forwarding a grant, and explain that the grant was made for that year only, and that no certainty of a grant for the succeeding year must be built upon it. As a matter of fact, however, the grants always were continued.

15543. Have any grants been discontinued?—No grants have been discontinued on account of inefficiency. The grant to one institution was lowered in one year on account of circumstances in connection with the work which did not meet with the Board's approval.

15544. (*By Mr. Latham.*) Are your grants at all earmarked, are they given for any special purpose, or are they handed over to the institutions to be spent exactly as they like?—No; the grants are made to each institution in respect of its work as a whole, subject to approval on inspection of the way in which it is carried out.

15545. (*By Lord Barnard.*) With this exception, that the grants given for the farms are distinct?—Undoubtedly; the grants for farms and the grants for subjects like forestry are quite distinct.

15546. Forestry has a separate grant?—Yes.

15547. Touching on what Mr. Latham put to you just now, I should like to ask you very generally whether the Board make any conditions as to their grants or are they merely given as the result of a general survey and inspection of the teaching and the work that is carried on at each individual institution?—They were originally given as the result of a general survey of the institution, and upon information as to what the institution was capable of doing and hoped to do, and the grants gradually grew until they have reached, at any rate, in the case of the higher institutions, a point at which it was deemed desirable to stop, and now no matter how much an institution may have developed afterwards, we are not able to give them any increased grant.

15548. As a matter of fact, the Board in giving a grant make no conditions with regard to it?—No hard and fast conditions.

15549. One condition which occurs to my mind and which has been brought to my notice very prominently throughout this enquiry, might be as to the form in which accounts should be kept and rendered?—We always ensure that the accounts are rendered to us in one particular manner.

15550. Is the form of that account prepared by an accountant, a specialist, or is it merely done by a layman?—The account that is rendered to us at the end of each financial year is a cash account which is submitted by the College itself, prepared by the registrar or other official at the college, whoever it may be, in the form we require; but we also make it a rule that before the grant is considered for another year, the college shall furnish us with an income and expenditure account, properly audited by an accountant. The reason for not doing that at the end of the financial year is this—that a great number of colleges do not use the financial year for their own purposes; some colleges end their financial year on the 30th June and some on the 31st July. That is not an uncommon thing, and it would, therefore, be impossible to get a strict income and expenditure account for the year ending 31st March, but we do see before the grant is made again that a strictly audited account is prepared and submitted to us.

15551. Have you ever in the course of your experience threatened any institution with a reduction, or withdrawal of grant?—Only in that particular case that I told you of in which a reduction was made.

15552. You have made no special demand, for example, as to the college buildings being adequate as a condition of grant?—No special requirements; of course, one would not in the first instance give a grant to an institution unless one were satisfied that the buildings were adequate.

15553. Having been satisfied in the first instance that the buildings are adequate does that hold good for all time?—Unless the buildings alter.

15554. Buildings, as we all know by experience, do alter, and the character of the institution may alter?—It has never reached that point yet in the slightest.

15555. (*By Lord Belper.*) The system has grown up from the beginning; you have only had a limited fund to deal with, and you have not been able to settle any definite system except to give such grants as you do give, according to your means?—That is exactly the case; and there has so far been no occasion to pursue any other course.

15556. That does not preclude you in the future from imposing such conditions as you may find it necessary to impose?—No; it would not preclude the Board at all from that.

15557. (*By Lord Barnard.*) I presume you only allow a grant if, in your opinion, a grant has been earned?—Entirely so.

15558. In the early days these grants were principally given for dairy purposes?—Yes. You will notice that the Paget Committee were especially interested in dairying, and priority was given to dairy instruction over agricultural education. As a consequence the earlier grants were mainly given for dairy classes, but agricultural lectures and field experiments were also included. Following the words used in the terms of the reference to the Paget Committee, the grants were originally given for "Agricultural and Dairy Schools." That was the term by which they were known, but one of the earliest recipients of a grant, in fact in that sense the earliest, because it came in the first year in which the grants were given, was the University College at Bangor, in North Wales. A grant was made to that College in respect of the general agricultural work which was being commenced there. That was in the first year that grants were made at all, viz., in the year 1888-9.

15559. Can you tell us what started Bangor?—Yes, I think I can; I believe, as a matter of fact, that it has been mentioned already in evidence here. The former Professor of Chemistry there, Dr. Dobbie, who is now at Edinburgh, started giving some lectures on experiments in connection with agriculture, and the chemistry of manures, in Anglesey.

15560. After Bangor all these other institutions gradually came upon the scene one after the other?—The Board were much impressed with the advantages of the system which was started at Bangor, and, in consequence of that, other institutions of a similar character in wishing to start agricultural work naturally took Bangor as their model, and after a consultation with the Board followed very much upon the same lines. The advantages of the Bangor system really were that it was practically bringing the best class of teaching in the University Colleges, what one believed to be the best kind of scientific teaching of its class in the Kingdom, in touch with practical farmers, so that the centre could assist the counties in their work, and be of real benefit to those with which they were in connection. The following extracts from a Report published by the Board of Agriculture in 1890-91, show in greater detail what these advantages appeared to be:—

"Speaking generally, it may be said that sufficient experience has been gained to feel assured that the plan of concentration works well, and is one which is capable of imitation. Under no present existing system is such a complete variety of subjects placed at the immediate disposal of all classes connected with farming at such a comparatively small extra cost.

"The quality of the instruction thus offered to farmers is of an unusually high nature, since the initiative is taken by a body of specialists skilled in almost every branch of science. Moreover, under this system, the different classes of instruction, at present carried on in various other parts of the country in an unsystematised and disconnected manner, are here made mutually dependent, while bearing, severally and collectively, direct relationship to the College.

"The dairy schools may be classed as the representatives of the purely technical type of instruction, and are fed by the dairy lectures. In time these schools may develop themselves and become more of the nature of farm schools, in their turn fed by the outside lectures on

agriculture and the sciences allied thereto. Again, the farm school may add horticulture to its general technical curriculum, and also forestry.

"Furthermore, experimental stations for demonstration already exist, and these often serve the purpose of texts for lectures to farmers and others; it is possible to develop these stations still more, and to connect them more closely with the technical school.

"Eventually it might be possible to have in each district the technical school, fully equipped at all points, existing as already said at the farmer's own door, capable of acting as a continual source of information and instruction for him, his sons, and his servants, and also for the local schoolmasters, but dependent for its origin and its maintenance on a body consisting of men whose lives are devoted to the pursuit of education in its most scientific and its highest aspects.

"It cannot be ignored that the key to the whole of this Bangor system is the Board of Agriculture grant. By means of it the College authorities can approach landowners and County Councils, and prove to them that they have ample security that the money they give the Colleges will be well spent, because the whole system has Government approval, and is under Government inspection; without that the system could not be the success which it is.

"It has been shown, however, that a most complete system of agricultural education can be organised by this College; one which will not only fulfil its own proper duties in the six northern counties of Wales, but form a type on the lines of which it may be feasible to organise systematic agricultural education throughout the kingdom.

"It certainly has this merit, apart from the intrinsic value of the instruction given, that under it local effort is called out to its utmost extent, but is at the same time systematised; while the Imperial authority is called upon for the minimum amount of funds which can be demanded by any organised system of agricultural education."

15561. The existing organisation has been largely brought about, as I said just now, by the assistance of the Board?—Yes; we have endeavoured as far as possible to assist local bodies and stimulate them in their work.

15562. After the passing of the 1890 Act, the Board withdrew their grants from local classes, and the County Councils themselves, since 1891, have undertaken a great deal of agricultural work?—They have under the Act.

15563. Before that date the only work of this description was that assisted by the Board?—That is the case.

15564. The Customs and Excise Act, 1890, introduced a new factor into the situation in consequence of what we have often heard spoken of here as the "whisky money" being placed at the disposal of the local authorities?—That is so.

15565. Is that the reason why the Board withdrew their grants?—Yes; the Board considered that purely local classes, no matter what they might be, dairy classes, poultry keeping, agricultural lectures and so forth, should be carried on entirely by the County Councils with the money which was then at their disposal, and that the Board's grants could be made of more value and better utilised by concentrating them upon those centres which were acting for a group of counties, and laid themselves out to be of assistance to those counties.

15566. In fact it seems to me in theory, at any rate, if not in practice, that the Board's work then became more a national than a local one?—Yes; generally speaking that is the case, but that policy was somewhat modified in later years.

15567. You mean by that, I suppose, that some purely local institutions now receive grants?—Yes. At first our grants were given only to those institutions whose work lay over a group of counties, but owing to our being able to increase the grants to a very limited extent some five years ago we were able to make grants—certainly small in amount, but, still, they were grants—to institutions that were working only for a single county, such, for instance, as the Holmes-Chapel Agricultural College or the Uckfield College, the former of which was working only for Cheshire and the latter only for East Sussex.

15568. You seem to attach great importance to counties and groups of counties. Do you think that it is really the best way of spending national money to apply it for the benefit purely of one locality?—We have endeavoured to pursue a totally different policy. In organising the

higher work we have endeavoured to get the whole of the country under institutions, in the first instance, which are working for a large group of counties.

15569. For a group of counties as distinct from the whole country?—As distinct from a single county.

15570. I say as distinct from the whole country?—The different groups make up the whole.

15571. There is one point that is not mentioned in your *précis*, and I am not quite sure whether you can answer it. Can you tell the Committee what the cost is to the country of the educational work of your department?—Of the two inspectors alone?

15572. No; the total cost of carrying on this inspection work?—I could not give you the total cost, because some of the education work is done in other branches of the Board, and it would be impossible to apportion it exactly.

15573. The next point in your *précis* is with regard to inspection. Will you tell us something about that?—A very careful inspection is made of the work of all the institutions which either are carrying on work of agricultural education, or which propose to do anything of that nature; it is, however, not only work such as one would generally understand by the word inspection, but largely that of an advisory and organising character. I think you have heard the fact mentioned at an earlier portion of my evidence that much of the work now being conducted all over the country under the various institutions has been started largely owing to the Board of Agriculture assisting local bodies to establish these institutions. The work is largely organising work as well as that of pure inspection. Centres started by the Board have risen to their present position gradually, and as the result of steady development fostered by the Board. As regards the work of County Councils under the Customs and Excise Act, 1890, by that Act very large sums were placed at the disposal of County Councils for technical (including agricultural) instruction, but no provision was made for inspection of the work. Several County Councils, however, voluntarily placed their educational work under the inspection of the Board of Agriculture, and written annual reports were made to them on the work thus inspected. They were visited regularly and closer relations were established; till ultimately it was found better, instead of making written reports as at first, to meet the committees and discuss with them the different points about their work which one wanted to bring before them.

15574. Are notes kept in the office of that?—Yes.

15575. Supposing there were a motion put on the Paper in either House of Parliament for certain information, the information would be forthcoming?—It would be forthcoming. Ultimately, after the personal inquiry into the agricultural work of all the counties, not only those who put themselves under our inspection originally, but the work of every county in England, the Board determined to extend to all the counties the assistance and advice they had previously given only to a few, and influenced by the fact of the want of provision for inspection under the Act of 1890, the Treasury sanctioned the appointment of an additional inspector for the work. I may say that the policy of meeting the various County Committees from time to time and conferring with them on their work has always answered satisfactorily, and many useful developments of County Council work have taken place in consequence.

15576. I suppose it is an advantage to them and to your Department also to know what other counties are doing?—It is an advantage, I feel sure, on both sides.

15577. It increases your own knowledge on the subject and it enables you to convey to one county the information you have gained from another?—Yes; it enables us to convey to counties in the South-west of England, for example, information that we have gained as to what is being done in the North-west of England.

15578. Then, with regard to the present position of the County Councils?—The present position of the councils is this, that although they are as ready as ever they were to help on agricultural education, if one brings any development involving fresh work before them, even although they see the advantages of it, the difficulty one is always met with, since the fresh burdens laid upon them by the Act of 1902 is: "Where is the money to come from?" When one suggests to a County Council, "Can you not take up a certain work?" they say: "Yes, but can the Board of Agriculture give us a grant?" and the reply has to be that unless there is an institution of a permanent character in their area which might come on the list of those to

Mr. A. E.
Brooke-Hunt.
17 July, 1907.

Mr. A. E. Brooke-Hunt. which the Board gives a grant, it is impossible to aid them. That is the real difficulty at the present time.

17 July. 1907. 15579. When you apply to the Treasury for your sum of £10,500, do you mention at all the institutions you propose to give it to, or do you apply for a block sum and reserve entirely to yourselves the distribution of it? Do you inform the Treasury how you propose to distribute it?—I believe that each year a block sum is mentioned in the estimates, but the distribution of it rests entirely with the Board.

15580. You issue this Report which we have made a great deal of use of here?—A Report is published on the institutions aided by the Board, and it now also contains a report of the work conducted by the several County Councils. I may say that information with regard to the work of the County Councils is collected by means of forms which we send out, and these are filled up by the different County Councils and returned to us. I have copies of these forms here if the Committee would like to look through them. We derive the specific details of the work carried out by the County Councils each year through those forms, and we supplement that with what we know of our own knowledge to be the facts of the case in each county. With regard to information as to finance, we have to be entirely dependent on the County Councils as to how they furnish their accounts and the amounts mentioned under the different heads, but I think the accounts they have furnished show, broadly speaking, what their expenditure is on different branches of agricultural education. I may also say that during the last two years we have published a reprint showing this work of the County Councils in a separate volume, because many of the members of the County Committees do not specially care to study the work set out with regard to the colleges in the earlier portion of the book. If they wish for that information, of course, this complete volume is at their disposal, but we find by simply publishing the work of the County Councils themselves, that the second portion of the book is very much appreciated and appears to be distributed freely amongst the members of the different Committees having to do with agricultural education in the various counties. They can thus see what the work is that is carried on in other counties, and can also see in a clear and tabulated form what the precise work is that is done in their own.

15581. Have you any evidence as to whether these Reports are very much studied?—I think they are since we have had this reprint, and been able to distribute it amongst the County Councils, because the County Committees seem very anxious to have copies; whereas before, when it was in one comparatively large volume dealing with the colleges as well, it was not so much studied. Now, however, so far as I can gather, the County Councils appreciate the reprint very fully and do study it.

15582. Is that all you have to say on the subject of inspection?—Yes.

15583. Now you wish to say something on the subject of the organisation of higher agricultural education?—Yes.

15584. Are these your own private views, or do they represent the views of the Board?—I have had no opportunity of specially consulting the Board, but I think all I mention as regards the past represents the opinions of the Board; of course, any suggestions I may venture to lay before the Committee as regards the future are made on my own personal responsibility, and based on the experience I have gained during the past 19 years in which I have been associated with the work. It seemed best to the Board in attempting to organise higher agricultural education, to begin at the top and organise the higher colleges, as funds were not available for treating the question as one complete whole. A scheme was prepared many years ago, in 1891, dealing with the question as a whole, and it was considered by the Board, but the matter was not pursued further.

15585. What do you mean "as a whole"?—I do not quite understand?—I mean all grades of agricultural education, not only the higher, but right down to the local work of County Councils. The functions of a University College, in connection with agriculture, have been already mentioned. Perhaps they may be summarised as follows:

- (1) To supply the highest course of instruction for sons of the larger farmers and landowners, for agents, and for those intending to become teachers.
- (2) To carry out systematic research.
- (3) To carry out or supervise all local field experiments.

(4) To give expert advice and information to farmers on specific points.

(5) To provide the highest type of lecturers for county work.

15586. What do you mean by providing the highest type—training them?—No, I mean having them on their staff so that they may be of use to County Councils if County Councils wish to have them. And—

(6) To generally assist counties, with which a college is connected, by advice, as regards all their agricultural work, and to examine schools, classes, pupils, &c.

I think I may say to my own personal knowledge that the system has worked well on the whole, decidedly well. I am not quite sure whether all the counties which are associated with colleges really look upon the college as their agent in everything. Some certainly do. The three Ridings of Yorkshire, with the exception of dairy work in the North Riding, carry on their work entirely through the Leeds University: those counties which are associated with the Midland Agricultural College practically do the same; but I am not sure on the whole that there is quite that close bond of union between the counties and the higher institutions which one would like to see. That may still be strengthened, I hope, in the future. I should like, however, to mention, as regards these University Colleges, that since the system first began of giving grants to them, another type of institution has sprung up of the nature, for instance, of the Harper-Adams College, which is carrying on work for two counties. It is a college which is situated in the country and young men have the advantage there of always having farming surroundings, and it carries on practically the whole of the work of a University college as regards agriculture, except as regards the highest instruction and (in the case of a University) the granting of degrees.

15587. I am not an educational expert and I do not quite know what the definition of a University college is. Would you call the Harper-Adams a University college?—No, the Harper-Adams is not what is known as a University college. The University colleges are those colleges which, to the satisfaction of the Treasury in respect of buildings, equipment, endowment, &c., are qualified to give the highest class of instruction in all branches of science, literature and art, and are in receipt of special Treasury grants. Reading is a University college, Harper-Adams is not. But what I wanted to point out was that whereas you have, we will say at Bangor, a University college (which is a constituent member of the University of Wales) carrying on the whole of the agricultural work in that district, you have now a college such as the Harper-Adams College, which is not a University college, carrying on all the general agricultural work, giving courses to the young men at the College, giving lectures in the surrounding counties and carrying on field experiments, but without the power to give the very highest scientific education at the end, and without being able to give a degree. What I want further to point out is that now there are one or two institutions of a University type in the country which while not willing to develop agricultural departments in the ordinary sense of the term, are nevertheless willing to carry on some agricultural work, to conduct research, and to provide a course which would be the final course before proceeding to a degree, and that the two combined really equal our original college carrying on the whole of the agricultural work of the district. In other words, we will say, the Harper-Adams College, plus the University of Birmingham, really equals Bangor. The young men at these agricultural colleges have this advantage, that they live in the country and live, as I have said, amongst farming surroundings, but they lose that intercourse with other students who are carrying on other branches of learning at the University College which always appears to us to be one of the advantages of the University College system. When, however, Manchester and Birmingham have been developed, as the Committee have heard they may be, and Bristol University College and the Royal Agricultural College at Cirencester are brought into the system, and Oxford has developed its agricultural department fully, and when this new college, the Seale-Hayne College, has been started in Devonshire, the Committee may consider that the country will be thoroughly well provided with institutions of the higher type.

15588. You remember the recommendations of the Paget Committee and the warning they gave against these institutions springing up haphazard all over the country?—Yes; they have always been before the Board of Agriculture, and I think we may say we have prevented, if

it was necessary to prevent, institutions springing up at random. All these institutions that have sprung up have only been started after very careful thought and consideration of the needs of the districts in which they are situated; but if these other institutions eventually come into the system, the Committee may be of opinion that the country will be fully well provided, though, perhaps, not too thoroughly provided, with institutions qualified to carry on the highest branches of agricultural education.

15589. You go a great deal beyond the Paget Committee because the Paget Committee suggested one national institution and four others, making five at the outside, and you have already got nine?—That is so, but, on the other hand, I think, if you really look into it, you will see that the recommendations of the Paget Committee have been largely followed. What they recommended was one central institution, in the first instance, for the purpose of training teachers of dairying, and the Midland Agricultural and Dairy College, as it was originally constituted, fulfilled that purpose. The British Dairy Institute at Reading did so also. The Paget Committee also recommended that there should be certain district schools which should carry on, not only dairy work but agricultural work as well, and that the central dairy institution should be developed in like manner. Thus, although we shall have rather more than the Paget Committee recommended, yet the whole system on which they based their recommendations has influenced the Board of Agriculture in supporting those institutions.

15590. Of course every new institution adds considerable expense, a larger expense than probably the mere numerical number of the students would justify?—I think you can hardly look at the number of students actually in the college for the purpose of forming an estimate of the work the college is doing. The college exerts influence in other ways than in the teaching of students, such as in the advice and assistance given to farmers generally, for a large number of farmers now go or send to the staff of each college for advice. That forms a considerable portion of their work, indeed much more than people are commonly aware of.

15591. Have you anything further to say with regard to the colleges?—No, that finishes what I have to say with regard to the institutions making provision for higher agricultural education.

15592. Now with regard to the technical work of County Councils?—I should like to refer, if I may, to the technical work of the County Councils, because one is frequently told that there has been a great deal of money wasted by County Councils in their expenditure on technical work relating to agriculture. I think while, generally speaking, mistakes may have been made at first, there were not nearly as many as there might have been, and the whole of the work of the County Councils in the way of such technical education has, as a rule, so far as it has gone, been of an excellent character. I should like just to refer to the different heads of instruction under which this technical work falls, but I will be as brief as I can with regard to details. The agricultural lectures, wherever these are properly given, I am sure are of very great value indeed, and I may go further than this and say that in Yorkshire, for example, where local agricultural lectures have been given very regularly ever since the department was started at Leeds, the instruction has shown a steady rise in quality as well. Matters are discussed with farmers now at local lectures in Yorkshire which would have been quite out of the question—almost Hebrew and Greek to them—ten years ago: that I think is very fair evidence of the good which these lectures are capable of doing.

15593. You say where lectures are properly given, but you do not tell us whether, in the majority of cases, they are properly given?—I think now that, where given at all, they are given properly. At one time they were not. But I think now all through the counties where this class of work is provided, the character of the instruction is higher than it was and good is being done.

15594. What have you to say on the subject of regular classes and winter schools of agriculture?—I suppose you mean a sort of winter courses?—I can only call them winter schools for want of a better name. I do not mean that special buildings should be erected for these winter schools; I think that secondary schools could help in this respect as regards buildings. These classes should preferably be started in places where there is a laboratory, and simple instruction could be given in agricultural chemistry, botany, veterinary hygiene, mensuration, and so on, the pupils being farmers' sons actually at work on the farm. From my own knowledge of local matters I think the ordinary evening lectures could be increased in value con-

siderably if they were held for a longer period of time at the various centres, and if, instead of four or five lectures only, as is the rule now at a centre, courses were organised lasting right through the winter, say twenty or twenty-five lectures, not only on agriculture, but, as I say, on other subjects as well, such as chemistry and botany, they would be a great success. I have in my mind several classes which have been carried on in that way, where those conducting them have had the advantage of a good building to meet in and where lectures have been given once a week to farmers and young men on agriculture, botany (from an agricultural point of view), and chemistry, and they have been of great benefit and well attended. I may say that I have, myself, seen quite elderly men most busily engaged in examining grass seeds of which before they had only the vaguest possible knowledge, and sorting them out into their different sorts, and, after a time, they have become thoroughly conversant with the seeds which they are in the habit of buying.

15595. Are these classes that you mention actually in existence or is it only a suggestion of yours?—There are some classes of the nature that I have described but they are very few and my suggestion is that they might be very largely developed.

15596. Do you suggest that a register should be kept of those who attend, or would you allow the students to come just as it suited them?—Those who conduct the work always take a note of the pupils that are attending.

15597. What I mean rather is, do you suggest that anybody passing along can walk in, or do you suggest that the names should be enrolled on a register as to each course of instruction given and some kind of certificate awarded at the end?—I do not suggest that anyone could walk in as they choose; the classes would be properly organised by the county carrying them on, and those responsible for them would see that there was a sufficient number of young farmers in the district willing to join before they were started.

15598. Do you mean the classes at these "winter schools" would be regular classes of which every member was registered at the beginning and then something done at the end, in the way of awarding a certificate or something of that sort, as a proof of the education that had been given?—Yes, a certificate might be given, but I do not know that a register would be necessary.

15599. Judging from the evidence given before us particularly from Scotland—I think from Mr. Macdonald—a certificate should necessitate two points: first, regular attendance and steady work during classes; and, secondly, some examination or test at the end?—Yes; undoubtedly there should be a record kept and a note made of those who attend. The only thing I was in the least hesitating about was your use of the word "register." Young men do not mind whether their names are registered or not, but you would get elderly men attending these classes also who would come possibly very regularly indeed, but who would very much dislike to have their names put upon a register and be marked up, perhaps, five minutes late or anything of that sort; but a list of those who attended, simply tabulated, I do not think they would object to. They would be regular systematic courses and I think, as I say, that the secondary schools might be of very great assistance in this respect, because they have the buildings already provided and teachers usually in chemistry and very likely in botany, and I think it might be perfectly well arranged that at certain of these secondary schools they could carry on this class of instruction, say, once or twice a week in the late afternoon. If so I do not think it would be difficult to get young fellows from the immediate neighbourhood, from villages within, say, a radius of six or seven miles, who would come in on their bicycles, and very likely you would get a number of those who had attended the schools in the day time. The secondary schools would have the buildings there, and I should think it is very likely that they could be used in the evening in that way.

15600. Do you know of any school being so used?—I have mentioned the matter in some places, but I do not know of any being used in that way at the present time. I should like to say further as regards agricultural lectures that, where they have been given, the old prejudice that farmers had against agricultural teaching has, if not absolutely and entirely, very largely now broken down. Farmers begin to see the advantage to them of science as applied to agriculture.

15601. I hardly think you need elaborate that because we have heard a great deal of evidence in this room on that point. Shortly, you confirm it?—I confirm it most

Mr. A. E.
Brooke-Hunt.
17 July, 1907.

Mr. A. E. Brooke-Hunt. thoroughly in every possible way; I would even go further.

17 July, 1907.

15602. (*By Mr. Latham.*) I think we might fairly assume this: where lectures have been a failure, it never has been the lectures that have been at fault; it has been the lecturers?—Wherever there has been any fault it has not been in the subject so much as the way it was treated.

15603. (*By Lord Barnard.*) You have something to say about agricultural labourers. You refer the Committee to the evidence you gave before the Small Holdings Committee?—Yes; I suggest that these winter schools might be of very great use to the young farmers but, as regards the agricultural labourers, I should like to see the experiment really well started of a practical school for labourers' sons. It would, no doubt, be far from easy now to get it carried out as there are many difficulties in the way, but at the same time, if it could be done, I think it would be well worth the experiment.

15604. (*By Mr. Medd.*) Have not you frequently recommended that the Mercers' Company should award leaving scholarships from elementary schools tenable at Reading?—No; certainly not from elementary schools.

15605. (*By Lord Barnard.*) When you talk of a practical school for labourers' sons, do you contemplate outdoor classes?—I will not say entirely, but very largely outdoor.

15606. Would the loan of a village school in the evenings suffice for the purpose?—No; that would not be a suitable arrangement because the work would need to be carried on in the day time and, in all probability, some of the pupils would be resident.

15607. You contemplate them spending their whole day at these classes then?—Certainly.

15608. (*By Mr. Latham.*) May I just ask at what age you would suggest they should go?—On leaving the elementary school; but I quite admit it would be a pure experiment and there would be very great difficulties in the way, although I do not think those difficulties would be insurmountable, and I am of opinion that it would be well worth trying the experiment.

15609. (*By Mr. Davies.*) Has not that experiment been tried at Bedford already?—It has, but not under conditions by means of which it might have succeeded.

15610. (*By Lord Barnard.*) It has been tried at Bedford but not under favourable conditions?—That is the case.

15611. Now, with regard to field experiment?—As regards field experiments I should like to emphasise the fact that they are absolutely essential everywhere, but the whole question requires very special consideration and development on lines which need to be very carefully thought out. Personally, I should like to see in every county a complete system of temporary plots for the purpose of testing soils, so that eventually what one might call a "soil-manurial" map might be made for the whole of the country. If that could be done you would have fairly accurate knowledge of the manurial requirements of the soils occurring on the different geological formations throughout the country.

15612. (*By Mr. Latham.*) Does that bring us to the point that you would issue a sort of syllabus to the several education authorities that those plots should be carried out at all the different centres?—I am afraid, under present conditions, that would not be workable.

15613. I thought that was what you were rather suggesting?—Eventually, if the conditions became more favourable and there was money at the Board's disposal to promote the work more completely, then, undoubtedly something of the sort might be done, and it would really settle the soil question all over the country. I would have also other plots in as many places as possible in each county each year to test some particular practical point which the farmers of the county might want tested. Further, I should very much like to see in each county one or more permanent manurial stations; they need not necessarily be farms in the ordinary sense of the word, but places where, having eliminated the question of soil, experiments of a more detailed character might be carried out and the results obtained in each county generally tested. Stations like that might also go in very largely for testing different varieties of each of the farm crops; for example, different varieties of wheat or barley which are used or likely to be used in the county.

15614. They would become research stations?—They would become more or less research stations.

15615. (*By Lord Barnard.*) Would you suggest that they should have any Government grant?—Undoubtedly they would require Government money before they could be started at all. I do not mean to say that Government money should be granted specifically for these stations; they would be part of the general scheme of each county which the Board might subsidise.

15616. (*By Mr. Latham.*) Is not that very largely carried out now by giving the several institutions opportunities of going on to certain farms and carrying on experiments? Is not information more readily disseminated in that way? I think Reading, for example, has nearly 20 farms where they have an opportunity of carrying out these different experiments?—Yes; no doubt a great many of the colleges have those facilities, but I should like, in addition, to see each county with its own permanent station.

15617. Would not it be better if you could get farmers in the different places round—I do not say in Berkshire or Buckinghamshire or Oxfordshire, because they have nearly 20 farms allocated to the College, but in other counties—to allow the colleges the use of their farms for the purposes of carrying out these experiments; you can call it research if you like, otherwise I think it would be localising it too much?—Yes, but beyond that, I think you want some permanent stations for more detailed and precise work.

15618. (*By Lord Barnard.*) You agree with me that it would be perhaps advisable for the Board to assist in systematising all these experimental stations?—Yes, as much as possible.

15619. So far as they are likely to be useful to the State?—Undoubtedly.

15620. Then as to dairying?—Probably in the country generally, including those which are at the different colleges, the Committee may consider there are enough permanent dairy schools, but there is room, I think, for a good many more of the peripatetic butter and cheese classes throughout the country. That was taken up very fully at one time, but now it has been rather dropped. I would like to suggest also that the system of having a migratory teacher of cheese-making in certain districts of the country requires considerable extension. It has been carried out in the North Riding of Yorkshire, and to a certain extent, I think, in Lancashire, and I know that, in the North Riding especially, a considerable amount of good has been done. The teacher goes about from farm to farm giving instruction and advice, and the people there so welcome his visits that they are, as I know, constantly telling him that they have been looking forward to his visit and wondering when he would be coming again. What has been done throughout the country generally in dairy work I am sure has been of very real value, and to my personal knowledge I may say that one never comes across any really bad butter nowadays as one did fifteen or twenty years ago.

15621. One witness from Lancashire told us that the butter that was made there was rather curious stuff?—Yes, I quite admit that perhaps in one or two north country towns, where they like things a trifle strong, you may get butter that you might not approve of, but comparing the butter that is made now with the butter that one used to get twenty years ago, I can see an enormous change for the good.

15622. With regard to the dairying classes to which you refer, those would not only be for the instruction of youths, but for the assistance of those who are actually engaged in the industry?—They are not for youths at all, but for those actually engaged in the industry.

15623. Your next item is poultry keeping?—Poultry keeping is a growing industry and an industry that lends itself to very great extension. It is especially of value to small men and cottagers. There is, I venture to think, need for some poultry stations where experiments can be carried on and instruction in poultry keeping should, I consider, be encouraged as much as possible. Especially amongst small men I have seen wonderfully valuable results coming from it, and, although poultry keeping is a small branch of general agriculture, it is becoming more and more of use to the farmer himself.

15624. It has made much progress?—It has made very considerable progress; one has only to go up and down the country to see it.

15625. And we may hope that it will continue to do so?—Yes, and it should be fostered as much as possible in reason.

15626. Does the same apply to bee-keeping?—The same undoubtedly applies to bee-keeping in a lesser degree.

Mr. A. E.
Brooke-Hunt.
—
17 July, 1907
—

15627. Then as regards farm hygiene?—With regard to farm hygiene which is another subject taken up by some County Councils as well as by some of the colleges, lectures on this subject, where given, have been of very great value. Personally, I have never found any difficulty arising with local veterinary surgeons. They have never really complained about the work that is done by those who are engaged upon it. Farm hygiene bears the same relation to farm stock as lectures on domestic medicine bear to the human subject, and, if properly handled, there is very little difficulty to be apprehended with the local veterinary surgeons, in fact it rather plays into their hands than the reverse.

15628. Farm hygiene depends on the conditions of the buildings to a great extent?—To some extent.

15629. It has been thrown at my head on some occasions that the construction of the buildings is a landlord's job?—That may be the case, but management of the stock does not entirely depend upon the buildings.

15630. As I began by saying, farm hygiene depends to a great extent upon the condition of the buildings?—To a certain extent. It does not depend on the construction of the buildings entirely, but no doubt that has something to do with it.

15631. Not entirely, to a great extent?—To a certain extent; I would not say to a great extent.

15632. So that it is a matter of importance to other classes, land owners and land agents, and so on, as well as farmers?—Undoubtedly.

15633. Then you have something to say about farriery?—Instruction in this subject has only been carried out, comparatively speaking, in a few counties, but I think it would be an advantage if it was extended to all. I might say the prejudice amongst smiths was very strong at first, and now it is just the opposite. Owners of horses, however, ought to back up the instruction by being willing to pay rather more for first-class work.

15634. We have had a great deal of evidence on that subject. Have you any suggestions to make as to that? Do you think there ought to be more public money given?—Undoubtedly. The work ought to be carried on in far more counties than it is carried on in at present; it ought to be carried on in all counties; it is of very great value indeed both to owners of horses and to farmers and to everybody who has to do with horses.

15635. I have no doubt you have attempted to encourage counties who do nothing in this direction, to undertake farriery work?—Yes.

15636. Can you give the Committee any idea of the reason why some counties have not carried out any farriery instruction?—The original reason and the reason that exists now is because of want of funds. Some have carried it out on the recommendation of the Board, but as a rule now, if one recommends it, they say they really cannot afford it; that is the chief reason.

15637. Can you make any suggestion as to how the counties which do not take up this subject might be induced to do so?—It all hinges on the question of expense. If the Board of Agriculture were enabled to assist County Councils directly in their county work, I have not the slightest doubt that all the work that I have been mentioning would be carried out and increased.

15638. Now, as regards manual processes?—Instruction in manual processes is beginning to fill a very great want both for young farmers as well as labourers. I think the good which is being done is probably hardly yet realised. Possibly it wants organising on a rather more systematic basis as regards qualification of instructors and the different ways in which instruction is given, but I should like to emphasise the fact that the work in those counties in which it is carried on is doing real good among young farmers and labourers, and deserves every possible encouragement.

15639. Do you think that if prizes were offered, that would be a good means of encouraging such work?—Prizes are given now, but it is a matter to which I think some consideration should be given. While the County Councils carry on the work of this manual instruction, I, personally, should like to see the local agricultural societies come forward more fully than they do and give prizes for it. I think in that way you would make this work very popular.

15640. Then with regard to horticulture?—Horticulture is a subject that I should like, with your permission, to draw particular attention to. I think horticulture is second to none in importance; and that thoroughly good work is already being done in several counties which should be extended to all. I think it is one of the most direct

ways of helping to keep young men in the country. I see on every side the immense value of the work which is being carried on, and the way in which this system of lectures in horticulture is giving men an interest in the country which they had not got before, and is tending to keep them there.

15641. I do not know whether you agree with me, but the impression I have derived from some of the evidence that we have had is that horticulture is not a very profitable employment?—I think it is profitable in many ways for these smaller men. I do not mean to say that it is an employment in which women can set up horticultural establishments of their own and make them pay, but I am perfectly certain for the small men in the country, the labourers, and so on, it is distinctly profitable, and I have constant evidence as regards that. It is also a most important thing to the labouring population throughout the country, in that it enables them to grow better vegetables for their families to eat; in many cases also it forms an addition to their income, and altogether makes their life different from what it was before.

15642. (By Mr. Medd.) Do not you think it is mainly a question of co-operation?—Not in the least.

15643. You have no belief in co-operation?—I do not say that at all, but this is not a matter of co-operation. The question that I am now on is one of individual labour.

15644. (By Lord Barnard.) Your next heading is school or other gardens; do you find that school gardens are a success?—School gardens are doing a very good national work amongst the young in giving them an early training that helps to keep them in the country in a way that nothing else does, but I think that school gardens ought to be managed on very practical lines.

15645. Do you think the Board of Agriculture might co-operate with the Board of Education on that point?—I think the Board of Agriculture might very easily co-operate with and assist the Board of Education in getting the gardens attached to elementary schools, which, of course, come under their supervision, kept on thoroughly practical lines, because I am afraid, if they are run in any other way, they will very soon cease to have the value they now have in training lads to be thoroughly good workmen.

15646. (By Mr. Medd.) Do you inspect the gardens in Staffordshire?—I have inspected a great number of gardens in Staffordshire.

15647. Connected with elementary schools there?—I have informally seen some of these, but the gardens I have inspected are those which were originally started and managed by the County Council for elder lads and young men.

15648. Is Mr. Graham Balfour, the man who has done so much for school gardens, to be called here as a witness?—The man who did so much to get these gardens started, unfortunately, can no longer be called here; he is dead.

15649. (By Lord Barnard.) You mention gardens for elder lads?—Gardens for elder lads and young men, I think, should be furnished by County Councils as far as they may be able to do it, because they, too, are capable of doing a very great national work.

15650. Are there any such gardens now, furnished by County Councils?—Yes, many of them.

15651. You think they should be extended?—I think they should be extended very considerably.

15652. We have heard a great deal of evidence on this subject, so that we do not want to go too deeply into it now. How do you propose to appoint the teachers?—Usually there are good local men who instruct, supervised by the County Council instructor—I am alluding to the gardens for elder lads and young men, not those attached to day schools.

15653. Now fruit stations. We have also heard a good deal on that subject?—There can be no doubt that fruit growing is making steady progress throughout the country, and as long as the country generally is prosperous, I think there is no fear of it being over done. The counties should be encouraged as much as possible to have one or more such stations in their area, such as the one the Worcester-shire County Council have at Droitwich, and these should be linked up with some permanent station such as the National Fruit and Cider Institute near Bristol.

15654. You think that these fruit stations possess a commercial value with regard to fruit growing?—Distinctly.

15655. With regard to the training of elementary school teachers, are you of opinion that the Board of Agriculture

Mr. A. E. Brooke-Hunt. might usefully co-operate with the Board of Education ? That, of course, is as to teachers who are going to rural schools ?—Yes, I think the two Boards might usefully co-operate as regards the training of teachers who are eventually going into those rural elementary schools, or who are already in those schools.

17 July, 1907.

15656. You will admit, of course, that such a subject as that is a matter entirely for the Board of Education ?—Yes.

15657. The Board of Agriculture can only treat with the Board of Education in an advisory way, so to speak ?—Yes, but at the same time many of the institutions which we aid at present do conduct those classes.

15658. That completes your review of the various subjects of instruction given by some of the County Councils ?—Yes.

15659a 15659. You refer to two extremes, the colleges and Universities at the top and the County Council itinerant work at the bottom, and you say that, between those extremes, there are three classes of institutions to which the attention of the Committee may be drawn ?—Yes, I have endeavoured to draw the attention of the Committee to colleges conducting the highest class of agricultural education and to the purely county work which is of a general, and practical kind. Between those two, there is a very wide field of work, which is, or may be served by institutions grouping themselves into three classes. In the first come special institutions, such as those conducting dairy work other than at colleges. Perhaps the Committee will consider that the dairy side of the Midland College, the British Dairy Institute, and the Eastern Counties Dairy Institute fulfil the wants of the country at present, so far as the higher branches of dairy work is concerned, but it does not follow that these Institutions may not be capable of further development.

15659b Then, as regards special horticultural institutions, the National Fruit and Cider Institute, the Horticultural Department of the University College, Reading, which I venture to say has done most admirable work, and the proposed new horticultural institute in Surrey—of which you have possibly heard—coupled with the Horticultural Station at Wisley, will, with subsidiary county stations, perhaps seem to the Committee to fulfil the present requirements of the country in this respect.

15660. To what do you refer as the proposed new horticultural institute in Surrey ?—There was a large bequest left by a Mr. Innes who lived in Surrey, a portion of which was left for the purpose of founding a horticultural institute, and I think it is possible that under that Will a fairly large amount will eventually be spent upon an institution for giving practical instruction in horticulture.

15661. That will be an endowed institution ?—Yes, largely so.

15662a 15662. If only largely so, from what other sources do you anticipate an income ?—Of course, all these institutions, even when they are endowed, eventually come to the Board of Agriculture and say they want more funds for developing the work. Then there is another class of institution that I wish to draw the attention of the Committee to, and one that I think merits their attention, and that is farm institutes or so-called "farm schools." You have had evidence before you from certain institutions which have generally gone by the name of "farm schools," such as that at Basing and the one at Newton-Rigg in Cumberland. I think "farm schools" is an erroneous name for such institutions, or, rather, it leads to an erroneous impression being formed of them, because people imagine that farm schools are for the training of children, whereas they are nothing of the sort ; they are really for young men or young women. This class of institution was foreshadowed in the Report made upon Bangor, previously referred to, where it was suggested that there might be practical schools—that the dairy schools which were then acting in connection with the University, might develop into schools of practical agriculture for that particular district, and it is institutions such as these that I suggest to the Committee are the great want in the country at the present time. The functions of such institutions really should be (a) to form the local centre from which all peripatetic county work should emanate, and to which it should point. In very many cases the county work is disjointed and has no definite aim. Such an institution should gather up all this work and focus it. If two counties combine (as Cumberland and Westmorland have done) to support an institution like this, and carry all their normal work out through it, definiteness and permanence would be given to the work. (b) To form the first place where

young men or, indeed, older men (but *not* children) should obtain those short and thoroughly practical courses desirable for them ; where the sons of the smaller men, as well as others, should receive their agricultural instruction, and to which they should be taught to look in after years. There, young men in winter should be taught the reason of the simplest operations and practice (the inner meaning, as it were, of everything) ; the use of different machines or implements, how to take them to pieces and put them back again ; there they should be taught neatness and method and have instruction in the minor industries of the farm such as poultry keeping, and there simple experiments should be conducted to show them how to carry out such on their own farms in after life. In summer, the institution would be open for young women to receive instruction in dairy work and poultry keeping. (c) To form for the best young men a feeder for the higher college, but these farm institutes should, in turn, be fed by the winter classes or "schools," which I have already referred to. Then the third class of institution, which I think is worthy of the attention of the Committee, is the agricultural school, on which the Committee have had some evidence. These schools are for boys and not for young men. I draw a distinction between them and the farm institutes, because the farm institutes are for young men after they have been on the farm for some time. These are for boys at school. They should, so far as my personal judgment goes, usually serve for the sons of the larger rather than the smaller farmers. Their "atmosphere" should be thoroughly agricultural, but they should embrace general education as well. They should act for a much larger group of counties than the farm institutes, and the Committee will probably be of opinion that only a few are needed to begin with. They, too, should act as a feeder for the colleges.

15662b

15663. What you say on that point is very largely a matter of opinion and trenches upon the debatable question of general secondary education ?—That, certainly is the case, but I should like to point out that the majority of pupils attending these schools would complete their education there entirely. Thus such schools would not come into the question this Committee has so often had before them, that a boy before taking up an agricultural course at, say, a university college, should receive only a general education.

15664. I think we may accept it from you that it is your view that in the case of boys who are going to be practical farmers, it would be desirable that they should be educated at schools of this character ?—Personally, I think it is highly desirable that schools of this character should be fostered to a limited extent until it is seen what their actual value is. From my own knowledge of the work carried on at West Lavington, which by its scheme is placed under the inspection of the Board of Agriculture, I think that if it was organised as I should like to see it organised, its value would be very great indeed.

15665. That really concludes all the definite items upon which you wish to offer us your views ?—Yes ; but I should like to add that I think agricultural education in all its grades wants looking at as a whole and a real national system built up.

15666. Do you say that because you do not think it is looked at as a whole now ?—I do not think it is sufficiently so. The Board of Agriculture, of course, have only had limited funds and are only able to actually assist the higher colleges, and there has, consequently, never been the opportunity, it appears to me, of thoroughly looking at the agricultural education of this country, the practical and technical education of the country, really as a whole. I think this Committee may be enabled to look at it in that light and to assist the country in that respect.

15667. There, of course, you adopt my view of the national—not as opposed to it, but as distinct from the purely local point of view ?—I am looking at it now from the purely national point of view. I think State and local authorities should go hand in hand and the whole system financed, not on a hard and fast rule, allowing one fixed sum and no more for each type of institution, but according to the needs of each place, such needs to be judged by the staff, work and equipment of each.

15668. Is that not the case now that the needs of each place are judged according to the staff and the equipment and the work that is done ?—Yes, but you have the same fixed grant for all the higher types of institution, no matter whether they receive £5,000 from local funds and the total staff employed involves an expenditure of £2,000

Mr. A. E.
Brooke-Hunt.
17 July, 1907.

or £3,000 a year or whether only a half or a quarter of those amounts is dealt with.

15669. When you say you are only enabled to give the same grant, you mean that you are only able to give the same maximum grant?—That is so.

15670. But you must have a limit surely in any case?—Undoubtedly; but the limit I suggest should be bounded by the requirements of the institution.

15671. Who are to be the judges of that?—Undoubtedly, the Board of Agriculture. My point is that each institution of the higher type receives what has to be our maximum grant, because it is impossible to spend further funds; the funds are not there to expend upon it.

15672. What I do not understand is why it should be a maximum grant in each case?—Of course, when first started, institutions grew, and as they grew their grants gradually grew also; they got more one year than they got the year before, because they were doing more work; but then we arrived at a point at which it was felt we could go no further, and that point now, in my humble opinion, is past.

15673. That limited maximum grant is only an internal regulation fixed by yourselves, is it not?—That is the case, on account of the amount of the funds placed at the Board's disposal.

15674. I mean it is not prescribed by Parliament?—Certainly not.

15675. It seems to me you have reached a sort of mechanical arrangement now by which each institution is absolutely certain of its grant, and although it cannot get any more, it is certain not to get any less?—With the highest institutions we have reached the limit at which we say "Unless we are furnished with more funds"—which was the answer that was given to the Deputation you introduced to the Board in December, 1905—"however much we should like to do it, and however much you may develop, we cannot give you more."

15676. (By Mr. Latham.) You say that "the needs are to be judged by the staff, the work and the equipment." Is that a good standard to go by?—What I mean is that some institutions may be doing admirable and excellent work but they can only employ a small staff. Another institution—take any one institution you like to name—doing far more work, treble and quadruple the work, must employ treble or quadruple the staff, and I think, having thought it over very carefully, that you can only really differentiate between the work of different institutions by considering what their expenses are. The Board would have to consider what are the proper expenses which an institution doing this work should properly incur, and having considered that, you could give your grants accordingly.

15677. Do you not wish it to be ruled at all by any subsidy of the local authority?—I think the grant of money which the local authority is willing and able to produce should, of course, be taken into consideration, but here in some cases you have one set of local authorities spending, say, £5,000 in respect of an institution and, in another case, other local authorities spending, say, £1,500, in respect of another. We have not got the means of saying that we will make a difference between those two institutions. We can only say that they are carrying on under our direction, and have carried on, the best type of instruction that we think they can carry on, and that the one in receipt of the smallest local funds is still, in the Board's opinion, fully entitled to their maximum grant at its present figure, but that, as regards the other, we have reached a limit of grant beyond which we cannot go.

15678. Some of the County Councils give little or nothing?—Quite so.

15679. The consequence is that those counties that give nothing will count as being badly served in the way of higher education?—Very badly served indeed; that is the case at the present time.

15680. And you cannot help, or ought not to help, in my opinion, unless the counties do something themselves?—I think all those counties which are doing very little work now would do very much more if one could encourage them by a proper system of grants.

15681. Yes, but it should be on those lines?—Yes, there might be some general idea as to what proportion might be borne by the State and what by the local authority in the case of each grade of institution. This would enable the Board to urge with some force on each locality the employment of an adequate staff and the carrying on of proper work.

15682. (By Lord Barnard.) I am not a member of a County Council at the present time and therefore I am not really personally familiar with County Council finances, but from whence is the county going to obtain money for this purpose?—Only from two sources, the "whisky money" or from a rate.

15683. Is not the "whisky money" already hypothesized?—To education, but not so far as I am aware to any specific form of education. The money which is still being spent on all this county work is largely, almost entirely I may say, from what is popularly known as the "whisky money."

15684. You yourself have told us that you are always met with the answer "Where is the money to come from?" I do not myself understand where it is to come from?—As I say, I think it could only come out of a rate where there is absolutely a lack of funds from the "whisky money."

15685. That is the second alternative, but have the counties power to raise a rate for this purpose?—Yes—in fact, more than one county has already done so.

15686. Does not that bring them under the jurisdiction of the Board of Education?—Not that I am aware of.

15687. You do not know?—No, that I do not know; I cannot answer that question.

15688. You consider that these institutions ought to be allowed to expand?—That is the main thing, from the colleges down to what I call the farm institutes. The main thing should be that institutions and their work should be allowed to expand as from time to time the Board found advisable, and that there should be elasticity in the whole scheme. For instance, although farm institutes are suggested for each county, or group of two or three counties, yet, where there is an agricultural school like that at West Lavington, it might possibly act as the centre for the county work and no farm institute be needed.

15689. What is it which prevents them from expanding now?—Want of funds. Perhaps I might add that what seems to me to be one of the main requirements, in order that there may be a complete system of agricultural education throughout the country, is that in each county or group of two counties, there should be an agricultural instructor and a horticultural instructor, and others in poultry keeping, bee keeping, &c.; together with local instructors in manual processes, all connected with the local farm institute. I will not any further pursue the subject of the farm institutes or of what I suggested with regard to the agricultural schools as I have already gone fully into them. I simply say that I think all that I have suggested means a development of the existing system which has practically been built up out of nothing; and the sole requisite is the means to freely expand. But I feel sure that in the future, as in the past, the State must lead; it will not do to wait for the localities to demand it; the State must, as far as possible, form public opinion on the matter and lead as it has done in the past. Might I in this connection read some recent remarks of Professor Rice, of Cornell University? They are, I think, very much to the point.

"It may not be considered out of place to digress long enough to say, that just in proportion to the wise liberality of the Government of a country in aiding by education and experimentation the producers of wealth from the soil, will that country win out, other things being equal, in competition with other countries of the world. Knowledge is power as truly in agriculture as elsewhere. Knowledge will ultimately triumph. Inasmuch as the nations of the earth are competitors in the markets of the world, it behoves each nation to arm its people with the most formidable weapon of either peace or war—educated minds and bodies. The Government that fails to recognise this truth voluntarily handicaps itself in the race with other nations, which in many instances these days are alive to the welfare of the people. The importance of this principle is particularly true when applied to the training of people engaged in the production and sale of the products of the soil. Therefore, money expended for Agricultural Schools or Experiment Stations is wisely invested. It is gratifying to note that England, which enjoys such an enviable reputation for good farming and progress, is not to be outdone by the other nations of the earth."

THIRTY-FIRST DAY.

Wednesday, 19th February, 1908.

PRESENT :

The Right. Hon. Lord REAY, G.C.S.I. G.C.I.E. (*Chairman*).

The Lord BARNARD.

The Lord BELPER.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. F. G. OGILVIE, C. B., called and examined.

Mr. F. G.
Ogilvie, C.B.
19 Feb., 1908

15690. (*By the Chairman.*) We should be glad to have any observations you wish to make on elementary and secondary education as connected with the reference to the Committee on Agricultural Education?—The point to which I wish to direct attention in that relation is that the whole question of education with reference to the interests of those who are at work in connection with agriculture is so knit together that it is quite necessary, in order that you may have a full perception of the position of the Board of Education in the matter, that I should put before you in outline the view of the Board as to their duties in certain aspects of secondary and elementary education. I will put that very shortly, if I may, because, while it is necessary to do so in order to get at the difficulties and possibilities in reference to adult education, it is not necessary for me to go into detail in the matter unless there is any point upon which any member of the Committee would desire to have further knowledge. I quite understand that the information the Committee desire to have from me refers to the section of the field of higher education that has special reference to the wants of those whose interests centre upon agriculture, and in particular, the point to which the Committee desire me to direct attention is that section of the field that relates to more advanced education—education, that is, in institutions for pupils who are beyond the ordinary limits of the school age. I also understood that you were limiting your inquiry to the case of higher institutions, that is, those of the standing of university colleges, and those more or less corresponding to that; I have learnt, however, from the Secretary that that is not the case, and that as a matter of fact you are engaged, or have been engaged, in considering also the development of the education provided for those who have left school, and are already engaged in some rural occupation, who are no longer giving their entire attention to study, but are typically represented by the evening students in town schools. That section of education is one which includes a very great variety of types of instruction, and I shall, therefore, devote some attention to-day to the methods by which the Board has been developing work in that direction.

15690b In the elementary school the function of the school is set in the forefront of the Code of Regulations which is placed on the table of the House annually, and forms the text, practically, of all elementary education. I would direct your attention to the first sentence of the introduction to the Code, which is this: "The purpose of the public elementary school is to form and strengthen the character and to develop the intelligence of the children entrusted to it, and to make the best use of the school years available in assisting both girls and boys, according to their different needs, to fit themselves practically, as well as intellectually, for the work of life." Now, the key-note of the Code in the case of rural schools is an insistence upon the development of the intelligence by including in the general course in the public elementary school such training, through matters of rural interest, as is most likely to attain the end in view. The work of the Board in that direction has

taken the form of developing nature study, of cultivating habits of observation, and generally of giving instruction in such a way as to encourage the development of observation and intelligent appreciation of the results of observation. I need not go into detail in the matter, but I may say that at a considerable number of places in the Code the indications of that are very obvious; and, further, the work of the inspectors under the Board who are engaged in inspecting elementary schools is systematically biased in the rural schools with the object of encouraging instruction of that sort. I may refer again to the Code, where you will see that under the head of observation, lessons in nature study, under the heading of geography, and so on, we have many of these points; and again we have the fact that in a country school the Board are prepared to approve a syllabus for arithmetic, or a syllabus in which the teaching of history, arithmetic and geography is less advanced than usual, provided that the time so occupied is devoted to the nature study of subjects suitable for country children. They therefore have set particularly in the front of their statement of policy in the matter of elementary education in rural districts the special cultivation that is desired there. It is a matter of regret that up to now the success, which has been considerable, is not anything like as great as people wish. I shall direct your attention presently to a few of the reasons for that want of full success; and as to the relation of methods for securing greater success, I shall direct your attention to other points that we have to consider. But there is one point I must draw attention to. The Board offer in the Code certain grants for special instruction, grants, that is, which cover the possibilities of giving instruction in dairy work, gardening, handicraft, some suitable for one type of work and some for another. In certain sections of that work the county local education authorities have done a great deal of good work, while in others they have scarcely touched on its possibilities. I mention that to show that there are grants offered in the Code which afford, wherever it is desired, aid for adaptation of the school curriculum to local circumstances. The Board, in fact, recognise the need for elasticity in the matter of the adjustment of the school curriculum, and they also realise that experiment in these matters is occasionally extremely desirable. They always endeavour, however, in the matter of introducing novelty of method of instruction, to guard against any waste of money or of effort in untried methods. They have methods tried, and those which are found successful are sanctioned for adoption wherever the conditions justify that.

15690c Then I would speak shortly of the provision made for higher elementary schools as well as the provision in the upper classes in rural districts. Special suggestions for the utilisation of the later school years of pupils who can remain in school for a year or two beyond the normal period of school life have been set out in a recent publication under the authority of the Board. That publication, while including very many valuable suggestions, is pur-

posely issued without the Board's imprimatur that everything that is in it ought to be adopted everywhere, but with the idea that it ought to be considered in relation to the special circumstances of each case. Those are the suggestions on rural education by Mr. Dymond, one of the inspectors of the Board. In that pamphlet the question of the function or possibilities of higher elementary schools in rural districts is discussed at some length. I, therefore, propose to put in a copy of that publication, to which I shall make sundry references, and I do not propose to go into detail in the matter. ("Suggestions on Rural Education," by Mr. T. S. Dymond, was handed in.) I should say simply that the higher elementary school is an institution that has undergone some considerable amount of examination in this country in the course of the last few years, and is now specified officially in a form that does afford very great opportunity of adjusting the organisation of the school to the requirements of the locality, and this particular grade of school is one which undoubtedly affords the possibilities of development required in country districts.

15690f Then with regard to secondary schools, I need do little more than remind the Committee of the general aim and the course of instruction in a secondary school. It is an aim including a general training of the faculties on a more liberal basis than is possible in the case of students whose only school time is that within the limits of the public elementary school. But I would also remark that in all secondary schools, whether country or urban, science and drawing are included amongst the subjects of instruction. So that where the student for an agricultural college has been trained in a secondary school before going to that college, and where he has passed through the entire curriculum of a secondary school, he may be expected to have had not merely the general training in literary subjects, and in arithmetic, and mathematical calculation, but also such training in science, both experimental and observational, as will form a satisfactory basis for the specialised study which he is to undertake in an agricultural college. Apart from that, which may be called the normal aim of the secondary school course, the Board in their regulations for secondary schools have made certain special provisions. For instance, in Sections 9 and 10 of the Secondary School Regulations there is provision for advanced scholars, or special classes, which, with the approval of the Board, may follow a course of study different from that approved for the ordinary school; that is, it is possible for a secondary school which is established in a district with a well marked interest in one particular industry, or set of industries, to develop on the top of the more general course a specialised course particularly adapted to the needs of the scholars there. There are, however, besides schools of that type, secondary schools in rural districts where the population is not large, and where the number of pupils who can be expected to remain up to and beyond the age of 16 is not great, and in such cases the Board has prescribed that 15 years of age may be taken as the limit, and a three years' course taken instead of a four years' course is the limit for the qualification of the school for acceptance as a secondary school. These points indicate, in the case of the elementary and secondary schools, the nature of the desire of the Board to cultivate the assimilation of the school curriculum to the requirements of the pupils. I mention that because at several points subsequently in my evidence on other matters I shall have to refer to the status of these schools, and to the possibilities of the work.

15690j I propose now to discuss instruction beyond the day school stage. Under that heading we have to consider, in the first place, part-time study, that is, facilities for the instruction of pupils or students who are able to give only part of their time to education. The Board issued a Memorandum on Courses of Work in Rural Evening Schools two years ago, and in that memorandum they drew attention to this particular part of their work, and in the forefront they mention this: "From the point of view here considered the population of any district, urban or rural, may be broadly classified in two divisions, namely (a) those whose circumstances justify a more or less extended period devoted to study, and (b) those whose position compels them to devote the whole of most working days to earning their livelihood, a class which, in rural districts, includes farm labourers, occupiers of holdings of less than 50 acres, village mechanics, small shopkeepers, working carters, etc. The educational requirements of members of the former class are to be met, and are already partly met, as regards preliminary training, by secondary schools and higher elementary schools, and, as regards further and technical training,

by farm schools, agricultural colleges, or by short courses in agriculture and horticulture. On the other hand, facilities for the further education of the less well-to-do members of the rural population have not reached a corresponding stage of development. In view of this fact and of the relatively large numerical proportion of such persons, it appears that in very many areas this matter is one to which careful attention should be given."

Then they proceed to discuss the difficulties of the case. These difficulties are, in the first place, that if he is to have a real appreciation even of the meaning and methods of the humblest of agricultural operations, it is most desirable, and in very many cases, necessary, that a man should have a good elementary education. That is, a good elementary education implying not merely an education in reading, writing and arithmetic; but such cultivation of the faculties as I have indicated is to be in the forefront of the aim of the public elementary schools in the rural districts. Now, in rural schools, apart from the fact that a full measure of success has not yet been attained in the adaptation of the curriculum, we have the further difficulty that pupils leave the school as a comparatively early age. There are many advantages in their leaving the school at an early age, but these advantages are accompanied by certain disadvantages. One of them is that the more ordinary matters of elementary education have not been made completely part of the equipment of the individual. Therefore the further training of these classes is a matter of the first importance. That further training takes two well-marked forms. I have indicated them in the heads of evidence under (a) "Short continuous courses of work, as in travelling dairy schools and winter schools for young farmers." I do not think I need say very much about that, because most of the members of the Committee will know already very likely what that means. But I simply mention that in the arrangements put forward in the Board's programme of work, and encouraged by the Board, there is provision for aid from the State to local authorities, who organise courses of the type indicated. Such courses are those provided by travelling dairy schools with a normal course of a couple of weeks, or in the humbler form of education, perhaps a one week's course. Again, in the winter school the winter course may be a ten weeks' course, or it might be only a four or six weeks' course, or it might be much longer.

Then under heading (b) there is reference to classes which meet regularly two or three times a week, generally in the evening, through a session, a session which in agricultural parts is generally coincident with the time of the year when there is less to do in the field. Now those courses are distinct from the others in the sense simply that there the attention is not so concentrated. There they are taking advantage of the odd time that people have throughout a portion of the year, as compared with the system of taking people away from their work for a short period, when arrangements can probably be made to meet their other requirements. It is under this second heading (b) that the work of continuing the incomplete general elementary education is carried out. Under that head we have classes where the bulk of the work is taken by the elementary school teacher, but that work is very often combined with special instruction given by teachers who are themselves engaged in some practical operation connected with agriculture. What the Board wish to see is that the agricultural bias, which is of the greatest possible value in teaching adults, should be imported into this class of work as fully as possible; that is, that all the work done should turn upon the method of teaching which is most likely to attract and continue to retain the attention of the pupil. In this Memorandum, of which copies have been handed round, there is reprinted an extract from the volume of syllabuses of the Board on pages 3, 4, 5 and 6, and that gives a general statement of the type of arrangement of work. I do not propose to go into that, but I would ask any member of the Committee who is not already familiar with the general idea of it just to look at these pages again. The outline of the matter is that we suggest a preparatory course in which, if it is a two nights' a week course one night should be devoted to reading, writing, composition, and so on, and the second night to woodwork, or other handicraft work, with drawing and mensuration, and in the summer months with gardening. As to the nature of the subject matter of instruction in reading, under the heading of "Matters of Rural Interest," it might include such things, as parish councils, parish meetings, co-operation, agricultural credit, and so on, and the work of the whole school should turn upon points of agricultural interest. Thus, whether under reading or arithmetic or composition, it is desired that as far as lies within the capacity of the

teacher—for that is really the only limit in the matter—the work should be technical; technical, that is, in the sense of being the development of the application of, say, composition to writing on a subject which has some bearing upon some agricultural operation, or if it is in arithmetic it should be the making out of accounts and setting them out neatly, and so on; and if it is in geography the geography should turn upon the district, and the means of communication by road or rail and post and on distances, times of transit, fares, routes, and so on. Those are subjects of instruction proper to geography, and are quite within the limits of the ordinary elementary teacher, if his attention is properly directed to the matter. It is in the proper direction of attention that the Board find they have been recently making considerable steps in advance, and it is to further steps to be taken in that direction that they look for the greatest improvement in this section of the work. Again, these two- or three-nights-a-week classes may be arranged for elementary or advanced instruction in special subjects for those who have previously completed a general education sufficient for their needs. That higher grade is possible so far as numbers of pupils are concerned, not in every small parish, but in centres which are accessible to a considerable agricultural population. Again, these weekly courses may include instruction in the meaning and method of a labourer's occupation, but, as I have mentioned already, instruction of that sort may be taken quite apart from the more common types of the class.

15690n Then I ought to say that the methods by which the grants of the Board are calculated are arranged upon a very elastic system, but that the elasticity is only being gradually appreciated by the local authorities, and it is only within the last year or two that the possibilities of working classes of this sort under the Board, and, therefore, of getting State aid for them, have been appreciated. Take this particular item. Supposing you want to have a class for labourers in hedge layering, or hedging generally, or anything in connection with woodman's work, it is possible there may not be anyone in the parish who can give instruction in that, not that there is nobody who knows how to do it, but that the people who know it are not the sort of people who are likely to be able to give instruction satisfactorily. If there were such a person in the parish he could be got to come up once a week and give instructions. If there is nobody of that sort in the parish then the local authority may arrange for some person to come and take pupils for a half of each day for a week or a fortnight for the particular branch of that particular kind of instruction at particular times. Instruction of that kind is quite as eligible for a grant under the Board as instruction in the more usual type of weekly evening lessons. Similarly, special sections of work may be dealt with in shorter courses, such as poultry-keeping, bee-keeping, and so on. Then there are other methods of work which do make for good agricultural education, but are not quite on such normal lines. In fact agricultural education, much more almost than other forms or sections of education, is capable of promotion otherwise than by instruction, and there have been until a couple of years ago some difficulties in the taking cognisance of methods of education other than formal class instruction; these difficulties, however, have now been so far got over, and the value of demonstration work—I mean demonstration of already ascertained facts as to manures, and conditions of culture, and so on, the value of demonstration plots for that, and the value, say, of demonstrations in connection with shows or with competitions in connection with shows—is recognised as being very considerable as an item contributing to the general education of the agricultural community. It is not formal instruction, but it is of an importance which is worth taking cognisance of, and which under certain conditions the Board do now take cognisance of.

15690o Then under the head (c) of the same part of the heads of evidence, I mention the training of teachers engaged in rural areas, that is, of those who are already teachers engaged as being in charge of schools, or giving instruction in schools in rural areas. The further training of these teachers with a view of their special work and special opportunities in rural areas is a matter that has been receiving much attention. The difficulty in locating much of the work to which I am now about to refer in the period of the training of the teacher before he enters upon his duties as a teacher is considerable. In the first place, teachers in training, or students in training colleges, do not know whether their field will be in the country or in the town, but many of them prefer to go to the town, and would not shut themselves out from the opportunities of promotion to the town. Others of them wish to keep their field for promotion as wide as possible, and

in any case it is not possible to earmark any large proportion at any rate of the future teachers for work in rural areas. This may be possible in the future. At the present moment it is not; and the fact remains that a great majority of teachers in rural schools have not had a training specially adapted to the requirements of the schools in their areas. Now it has been made possible for local education authorities to take steps to give supplemental training to such teachers. The Board has been in season, and, I might almost say, out of season, pressing upon local authorities this part of their duty as well as their opportunity, with the result that we have had a considerable number of excellent classes of instruction for teachers, in Saturday courses, where teachers come to a central place every Saturday for a spell of instruction, and in summer courses and vacation courses generally where they go for two or three or four weeks to some centre where a good course is arranged. This supplementary training of teachers has a very great influence upon the work of the teacher in his elementary school, and even a greater influence upon his work in connection with the evening school, because if once a teacher's interest is arrested by the subjects which are proper for special attention, in rural areas, he realises the advantage of the evening work from a point of view that had never occurred to him before.

The difficulty, however, at every point is the difficulty of teachers. That is the main difficulty. It is the difficulty with which the Science and Art Department, in this matter the predecessors of the Board of Education, struggled with but small effect for many years, and it is only since the Act of 1902 placed the whole of the education of the country upon a definite basis, as a network, that it has been possible to face this question. The training of the teacher implies that there is somebody to train him, and it has not been possible to make any very phenomenal advance in the matter of agricultural education in the section to which I have just been drawing attention, because you cannot train a teacher unless you have somebody who knows the kind of training that he requires, and who is capable of giving him that kind of training. It has, therefore, been necessary to take the greatest precaution to see that we should get the advantage of having in the various areas people who really have the right sense of what is required in this matter, and that these people should have opportunities of meeting and instructing teachers in matters which would give them a chance of really effecting their purpose.

15691. (By Mr. Medd.) Before you proceed further, may I draw attention to one point which I think has been omitted. Is it not the fact that teachers may now proceed for a third year's course of training to an agricultural or horticultural college?—Do you mean teachers in training at training colleges?

15692. No, I mean that teachers who are qualified acting teachers may now proceed for a third year's training to an agricultural or horticultural college?—Yes.

15693. You had not mentioned that?—No. The real difficulty is that we have already got a large stock of teachers who are likely to be with us for a generation, and the sooner we can get the existing teachers' qualifications extended in the direction that is desirable the better. The coming teachers are having their attention directed to this matter as they go on. I am not very hopeful that the provision to which you have directed attention is one that would be effective as regards a sufficient proportion of the future teachers to make it really a large step.

15694. No, but it refers to acting teachers, does it not?—Yes.

15695. And they are permitted, under the present regulations, to proceed to agricultural or horticultural colleges?—Yes, but my point is that though that is, no doubt, very good, yet, if a man is going to give up a year of further study to professional training, he will expect to get something better than an ordinary rural school. Now if the lower grade rural education is to be conducted properly, we must get the average man in the rural parish to be qualified to take the part that he must take in it. There are only certain things that would fall to the professional public elementary school teacher, but those things he ought to be able to do. The other matters would have to be dealt with by other people, and these other people have been extremely difficult to develop, even in urban centres where they are required for technical education other than agriculture. In rural districts it is still more difficult to get a man who is a practical man and also a good teacher, and that is why, in rural districts, it has so frequently been necessary for that provision to

15690p

15690q

15695a

be made by securing a staff of instructors for specific things, who will give their whole time to instruction. The number of people who are really likely to be good instructors is comparatively small amongst those who are masters of the practical work which is the basis of the instruction. With reference to that special training of teachers, I will mention two things to indicate the kind of thing that is necessary. In the training colleges the Board of Education want to get the training of students made as good as it possibly can be made. Now in nature study, if the teachers there are well taught as to the methods of study and instruction, a great step will have been taken. Three or four years ago the Board arranged for a special course to be given by Professor Miall, who perhaps had given more attention to this matter than anybody else in Britain. He gave a special course of a month in South Kensington, to which the Board brought up a number of teachers in training colleges, that is, members of the staffs of training colleges, with a view to their being instructed by Professor Miall in the matter and as to the methods which, in his opinion, were most suitable for this work. Again, two years ago, with a view to encouraging a good type of teacher for agricultural subjects of a more advanced kind, the Board arranged with Mr. A. D. Hall to give a similar course upon the study of the soil, and to that course were brought up a large number of the most likely men, junior members of staffs of agricultural colleges, instructors in agriculture or those who were instructors in horticulture and teachers under County Councils, and so on—people who were likely to be conducting courses of a more advanced kind for the study in the study of the soil. They were brought up to that course. By methods such as those the Board are endeavouring—and it is an endeavour which will take some time to reach a quite satisfactory result—to improve the teaching supply in the country.

Next I will give a short statement about the local organisation for such work. There are two points I wish to make plain; the first is that, so far as part-time study is concerned, this is a period of transition. I have already referred to the fact that it is only within the last two or three years that we have got into a satisfactory system of distribution of the aid through the Board for part-time study. But, at the same time, we have drawn the attention of all concerned to the importance of courses of study with a suitable combination of subject matter as distinct from what used to be regarded as the essential basis of it, that is, the separate treatment of each subject. Now we have been doing what we can to replace the system of grants for separate subjects by a system based upon progressive courses of study, dealing with several related subjects. In urban areas courses in commercial work, or courses in engineering work, running into two to five years of part-time study, have been introduced very generally. Similarly, courses of work, including technical subjects, are being gradually established in agricultural areas in rural schools. This Memorandum gives an outline of the lower part of the work, especially because we have found that there was most need, really, to spread a knowledge of the kind of work that could be done there. The difficulty has not been merely that of spreading a real knowledge of this, but of securing attention to it, because the Board of Education themselves have been, as everyone knows, somewhat fully occupied with matters which did not relate to technical education since the Act of 1902 was passed, and the local education authorities, too, have had their attention not a little distracted by other matters. So that, altogether, it has been somewhat difficult to get a full measure of attention to this particular aspect of the work. But still there has been, as I have said, a very great improvement in that way. What has been recognised for a number of years is that the form of the teaching of the science of agriculture as a subject of more advanced study depends for its value upon the quality of the preparatory work, and in many schools now we find that a sufficient preparation is being afforded for the real teaching of agricultural science. The change in the attitude of the Board of Education in this matter is perhaps indicated as well by the position of the Board's examination in agriculture as by anything else. Some years ago the Board had prepared for it by a special committee a revised syllabus for an examination in agriculture. That is a syllabus which makes it clear that for scientific knowledge of agriculture to be obtained, there is required much systematic study, and the effect of the change thus introduced was, as it was intended to be, at once to cut off a great deal of the teaching which had been going on under the name of agriculture and which had really not been doing any good at all, or very little good. It made perfectly plain that what was required was worth attaining,

but that it could not be attained unless by prolonged systematic study upon an adequate basis. The syllabus shows that the examination is intended for those only whose training and whose capacity and whose opportunities justify them in expecting that they will attain such a knowledge of agriculture as that indicated. Examination in agriculture is no part of the programme of the Board for the practical farmer, unless it be for a man who is to go into farming on a considerable scale, a man whose work would then fall to be tested, not by a separate examination, but by the work that he did in a continuous course of training suitable in extent for the work that he was going to do.

The next point in the local organisation is that the Board have introduced in all their activities in technical education, first of all, in schools of art, and then in technical schools, then in all rural areas, the principle of recognising the work of an institution or an area as a whole. That is to say, in the school of art, instead of taking up the separate subjects, and pupils, and so on, as they did several years ago, they intend to measure the value of the educational work done by the school as a whole; and the grant depends upon that. Similarly, they have an alternative system for technical schools, the two systems going on alongside. Where one is more suitable, they take that one, and where the other is best, they take the other. Similarly, in rural areas, they have announced an article in one section of the Boards' regulations which deals with an alternative method of grant (that is Section 34) by which the work done in the area is taken as a whole. With reference to that work, which is a most important new departure—that is Section 34—I will read the paragraphs on page 4 in the Regulations for Technical Schools in the year before last. This is from the Regulations of the year 1906-7, at page 4: "In Section 34 of the new Regulations the Board have made provision for an alternative scheme of Grant for so much of the educational work of a Local Education Authority for any Administrative County other than London as falls within the scope of Chapter 2 of the Regulations. Owing in a large measure to the conditions under which Evening School Work and the lower and intermediate grades of technical instruction have been developed too little thought has been given to the correlation of the various existing forms of education of this type, and to the utilisation of the various activities and of the funds available for their provision and maintenance in the manner best suited to the areas which now form the educational unit. It thus too often happens that the further education in the evening schools of an area is seriously retarded owing to the fact that the provision made for it throughout the area has not been considered as a whole," and so on. I should perhaps refer to the succeeding regulations, those for 1907-8, of the present year that is, copies of which I have just circulated, and I refer to page xi. and page xii. of these, where there is a passage which deals with the same point. I think perhaps I may read through that, because it summarises the matter: "In circular 620"—copies of which have been circulated to the members of the Committee—"which was issued in July last (*i.e.*, July, 1906), to the Councils of Administrative Counties other than London, the Board gave details of the alternative conditions of grant announced in Section 34 of the Regulations. The provisions of that Section aim at encouraging efforts to meet the special difficulties of organisation inseparable from the work of technical education in rural districts. When the Local Taxation (Customs and Exercise) Act, 1890, placed at the disposal of County Councils funds which they might apply for purposes of technical instruction, many of them devoted ready attention to the needs of sections of the agricultural population, but few developed schemes which were both organised and complete. Moreover, much valuable instruction has been given under conditions somewhat different from those directly contemplated in previous issues of these regulations. The experience now gained by the operations of local authorities in this matter has established principles of general application as to the methods and matter of instruction most likely to prove effective, and the alternative conditions of grant should assist county councils in making provision for all the educational needs of their areas so far as these are within the province of Chapter 2 of the Regulations." That refers to education of the type I have been discussing. Then it goes on: "The Board recognise that in any scheme which is to be effective there must be considerable elasticity of method, and in awarding grants, they take account of the full measure of the educational value of the demonstration and practical work in rural schools is so often required as an essential extension of class instruction." I do not know that I need read the succeeding paragraph.

Mr. F. G. Ogilvie, C.B.

—

It enters into detail in case that may be necessary. But perhaps I might refer to the middle of the next paragraph over the page, where it says: "Among the subjects of instruction may be named the continuation of elementary education and its direct application to the commercial side of rural industries; handicraft, and simple calculations of areas and quantities as for the garden, the field, and the market; conditions of life and growth of plants and animals; gardening; care of stock; dairying. In addition to the normal evening school conducted by a local teacher interested in rural affairs, the scheme of arrangement would include supplementary instruction by visiting special teachers, short courses by itinerant instructors, winter courses of some weeks for farmers' sons or daughters; and instruction given by means of demonstration plots, school gardens, and supervised work on the farm, and by competitions and demonstrations at agricultural shows." Then there is a note with reference to teachers. These, and the forms which have been sent round, will serve to indicate the lines upon which the Board has been pressing for further attention being given to this most important part of the work.

Shall I proceed with the full time instruction now, or is it convenient that I should complete my general statement.

15696a (By the Chairman.) Yes, proceed with the full time instruction, please.—As to the provision for full time instruction, there are two grades of instruction that require attention in practically all matters of technical education, including agricultural. These two grades, so far as they fall under the Regulations of the Board, are administered by the Branch for which I am responsible, under two Sections: one is Section 42 of the Regulations in your hands, that is on page 15, Day Technical Classes, where we have schools of lower grade than colleges. Section 42 says: "In special cases grants may be paid in respect of instruction of students in day technical classes, whether detached classes for advanced work or"—and this is more important—"grouped classes affording organised instruction in related subjects adapted to the technical requirements of students." Those classes may be for students of any stage of advancement. Under this section we treat a very great variety of things, each according to its own circumstances. We have classes for defective pupils, who are under instruction in various subjects; and we have classes for instruction having a bearing upon particular trades of women, for example such as upholstering or anything like that; and we have classes for the training of young women in domestic arts. Perhaps I may cite one *à propos* of your enquiry, the school at Worleston is an illustration of the work done for schools of a lower grade than colleges. Again at Wisley there is a school working under this section where practical work in horticulture is combined with instruction in the principles of science that underlie horticulture, with instruction in physics, chemistry, botany, mensuration, practical geometry and field geometry, and that sort of thing. But there is no general requirement under the Section as to the standard of attainment that students or pupils must have before they enter such a school. Each school fixes its own standard. The one at Worleston has its own standard. One for young girls or young lads doing some lower work would have a lower standard.

15696b The main provision under the Board for higher technical instruction is taken under the preceding sections of Chapter 3. Chapter 3 is mainly concerned with technical institutions. A "Technical Institution" is an institution which gives an organised course of instruction in day classes, including advanced instruction in science or in science and art. That is set out in Section 35. We require before recognising any place as a technical institution that it should provide at least a two years' course. Most of them provide a three years' course, and many of them a four years' course of instruction; and it is provided that the standard of a pupil's education should be such as they may be expected to attain after a fair secondary school education. The normal standard is for a pupil over 16 years of age and qualified by general education to profit by a course of advanced instruction. For the present (and this applies to but very few cases now), pupils may be taken in under 16 if the inspector is satisfied as to their power of following the work. The position of a technical institution in the scheme of the Board is that practically of the highest institution in respect of Government grants through the Board in respect of its technical work. The maximum grants are £10 in respect of each student who gives full attendance during the first year, £12 for a second year, £15 for a third year, and £15 for a fourth year; so that where an institution is doing good work and has a fair attendance of students, its income

from grants is really very considerable. We find that in the case of technical institutions, very great attention requires to be paid to the type of institution that is recognised, and I think perhaps it would save time if instead of talking generally on that point, I should make it pointed, and consider agricultural institutes. Agricultural institutes provide whole time instruction for students who are beyond school age, and who have completed something like a secondary school education up to at least 16 years of age, and perhaps 17. What we find is this—I mean what we find generally, and what we know from observation elsewhere, as well as in England—that no system of provision of schools and colleges of this type can be satisfactory unless it is based upon a clear conception of the requirements of the case. The essential difference of programme and of methods between different institutions depends upon such things as the previous education of the students, the period of the courses, and the final occupations which the pupils have in view. For instance, we have many good examples now in England of institutions of the type of university colleges or their equivalent, giving, say, a three years' course, or a four years' course even, corresponding to the best type of technical institution related to other industries—a course of instruction extending over three or four years—based upon full instruction for the work, and including the application of science to the essential parts of agricultural practice. That is one type of course—a course which includes a considerable proportion of science. Where, on the other hand, you have only to work towards a two years' course, as for a farmer's son, who has had a fair secondary education with some agricultural experience and who is going to take to work on a farm, the proportion of the different studies is necessarily different. The type of curriculum of that school is not the same as the type in the other. It is not good enough for a man to take two years of a four years' course and imagine he has made a half progress towards the end of that four years' course. Still more different is the case of an institution which has to make the best of a one year course. That is, there are people occupied with rural interests for whom one year may do a great deal—that is, one year of continuous consecutive study. But if it is to be only one year's study it should be definitely one year's study, and the whole curriculum must be prescribed upon that basis; and, not only so, but the institution in each case must be definitely related to the schools by which it is to be fed. If it is to be fed from a particular group of schools, and schools of a particular area, then there must be some direct and secure means of seeing that the preparation of the students in those other schools of the area is just what is necessary for the work that is to be done.

To such points as those we have been giving great attention in sections of technical instruction which have been entirely under the charge of the Board of Education, and the development of the technical institution has been most carefully watched. We have done our best to prevent an undue multiplication of institutions with ill-defined aims, and we feel satisfied now that the result is going to be much better than if we had allowed these institutions a very free hand in development in the first instance. Certain agricultural colleges are dealt with under this head. One I may mention here is the Harris Institute, Preston. That is an institution to which the Board have made grants for a considerable time, and it is an example of an institution which is also now in receipt of a grant from the Board of Agriculture, and is therefore an illustration of a difficulty which has arisen in the allocation of national aid by the two Boards in a field within which it is difficult to allocate the interests. In the Swanley Horticultural College we have a corresponding course in horticulture—a course, that is, of three or four years, where in the normal three years you get good work done on a scientific basis and adequate for the purpose in view. In the Harris Institute we have had some difficulty in determining the precise natural limits of work for which the Board of Education grants and the Board of Agriculture grants respectively should be regarded as allocated. The difficulty in an institution of that sort is considerable. In the Harris Institute not only do you have common teachers, that is to say certain members of the staff giving instruction to students who are agricultural students, and to students who are in another part of the institution, technical students, that is (because there are other departments of technical work besides agriculture in the Harris Institute), but we have also teachers giving part of their time to agricultural courses and part of their time to other advanced technical courses. We have classes, say, in mathematics, or mensuration classes in which certain pupils belong to the agriculture group, and certain pupils belong to other technical

15696c

15696d

groups. Then again, we have the difficulty that one of those classes must be inspected and examined for purposes of general technical education, and at the same time obviously in the instruction of those subjects, whether it be chemistry, or mechanics, or mathematics, that is given as preliminary scientific work, the agricultural student has to be seen by the same examiner. Finally we have the difficulty that where an institution is a complex one, like the Harris Institute, it is very difficult to get at a precise statement of how the money which goes into the institution for different purposes is spent. Where you have a complex institution, you really can only treat it as a single unit for the purposes of finance. That is an indication of one point on which you have a difficulty combined with an economy in the co-ordination of different sections of education.

15696e In the next paragraph of the heads of my evidence I have drawn attention to two or three points in which the co-ordination of agricultural education is notable. For instance, I have already referred to the cultivation of the aspects of secondary and of elementary education which bear more particularly on this question in rural areas. I speak of the utilisation of the services of a visiting teacher in horticulture for day school gardens and evening school classes in gardening. That is, if you have a man on the ground to give instruction to the day school, the cost of the instruction provided for an evening school is really less if you use that man. It is economical to combine day and evening provision for specialised instruction. Again, there is the utilisation of the services of the local public elementary school teachers for the work of evening schools in conjunction with the special expert teachers for agricultural instruction. I have referred to that, and I mention it here simply to draw attention to the means of facilitating co-ordination by having the same local officers in charge of the work in the different departments. Again, there are the facilities for improving the qualifications and extending the interests of teachers. Where you have the public elementary teacher the servant of the authority for both purposes you are more likely to have that authority, being responsible for both purposes, taking steps to improve the teachers' qualifications. I have already, I think, gone into detail and need not go into further detail about the courses.

Then the use of buildings is found to be a very great difficulty. One sees that in other parts of the world not very far off. Where you have different school authorities dealing with different sections of education, you have often very great difficulty indeed in getting the use of buildings which have been provided by public money for various functions of education that are of importance in the area in question. I do not think I need dwell upon that.

15697. (*By Mr. Latham.*) Are you speaking of night schools?—Day and night schools.

15698. But you can always have the elementary schools at night?—Yes, we can.

15698a One has only got to look to the other side of St. George's Channel, where you find the difficulty arising because of the different Boards and separate national boards. The National Board of Education has charge of the elementary schools, and the Department of Agriculture and Technical Instruction has charge of agricultural and technical instruction. There is very great difficulty in getting the use of schools, not merely because of the central boards being different, but because the local management is different. Where you have the whole management interested in both sections of education, artificial difficulties never arise, and natural difficulties are more easily overcome. That is the point I wish to make on this matter.

15698b Again, there is the supervision by the County Education Authority, which is of great advantage in keeping these things together. Then where you can have several advanced schools in one institution you can very often get an economical use of the teachers, whose time each separate section of the institution could not afford to employ; but having the sections together, they can employ the full time of such men. The utilisation of the colleges as central institutions is a special case of advantage in this co-ordination question. I need hardly dwell, I suppose, upon the importance of the college being regarded as a central institution, for I understand that in your enquiry you have dealt with the matter. Obviously in the first place it is of the greatest advantage to the college, because it keeps the college staff in touch with people who are at work throughout the area where the college is planted, and therefore it keeps the area informed as to the fact that there is a college, and that there is somebody going about who is always in a position to give information as to steps to be taken towards further education on various points. That

the college may be a real centre of information, it must be an essential part of a general scheme so that the staff may radiate from the college, and that thus the occasional courses may be superintended, or there may be superintendence of demonstration plots or advising local managers, or whatever it may be. The college is the centre from which a great part of the pioneer work ought to come. It is possible to use a college in that way, though it is not part of an organisation, but the possibility becomes a fact when the college is worked in as a section of the organisation. I do not think we need go further than look at the work which has been possible in Scotland, where the whole of the organisation has been under the same department—the work which has been done in Scotland since the agricultural colleges in Scotland have been transferred to the department which has been responsible for all the other education of the country. The Scottish agricultural colleges (there are three of them) have been developed in full and proper relation to the work required in their separate areas. I do not know whether you have had any evidence from Scotland as to the importance of this matter, but if so, I need not refer to it.

15699. (*By the Chairman.*) Scotland is out of our purview, but you are justified in mentioning it, of course?—Perhaps I ought to say first, that I have been five years now with the Board of Education. Previous to that my work was in Scotland, and, as it happened, I took a considerable part in the development of agricultural education in Scotland, and therefore I am speaking simply now as one who knew what the work was up to five years ago from being personally very much concerned in that work, and I may say, further, that I have kept myself informed of the work that has been done there since. I should say that the greatest possible advance has been made in agricultural education in Scotland not only since, but as a result of, the transfer of the agricultural colleges in Scotland to the Scotch Education Department; not because that Department was better qualified to manage those colleges, but that the Scotch Education Department was in a position to work in the case of the colleges there in the best manner possible, not only with the institutions which had to work below them, but with the institutions that had to work alongside of them. It has been possible to make the colleges part of the web of educational work, and that influence has been of the greatest possible value in organising agricultural education in each of the areas, and in bringing the colleges into the fullest and closest relation with all other agencies at work in the direction in which the colleges are there to work.

15700. (*By Lord Belper.*) You mentioned Ireland just now and the success attained there, and can you point out how that is an argument in favour of your view?—Because in Ireland you have the whole of the technical work under one department, the Department of Agriculture and Technical Instruction. The difficulties that there are in Ireland arise entirely, so far as education is concerned, because of the fact that the secondary schools and the elementary schools are under other departments. The work of the agricultural department, like the work of the technical side of the same department, is hampered by the separate control and the separate local management of the other sections of schools.

15701. In Ireland the work is under an agricultural head and not an educational head?—The department of agriculture and technical instruction is in Ireland a joint department which is under one head—one Parliamentary head and one secretary.

15702. Not under the Board of Education?—There is no Board of Education.

15703. But there is some control of elementary education there?—It is the weakest point in the agricultural education of Ireland that it has not got any direct connection with either the elementary system or the secondary system, and that weakness is appreciated very fully by the various officers who have to deal with agricultural education in Ireland. The strength of the Department is that it is fully in touch with all sections of agricultural education and with all sections of technical education. It is worked on parallel lines with technical education. The technical institution and the agricultural institution work into one another, but these institutions are not and cannot readily be brought into working correlation with elementary and secondary schools. In Scotland there is an absence of these difficulties.

15704. (*By Mr. Medd.*) But you do not advocate technical instruction in elementary and secondary schools. do you?—I do not advocate agricultural instruction in

Mr. F. G. Ogilvie, C.B.

19 Feb., 1908

Mr. F. G.
Ogilvie, C.B.
—
19 Feb., 1908
—

elementary and secondary schools. But I must make myself clear on that. I do not advocate technical instruction, nor do I advocate agricultural instruction in elementary or secondary schools, but I do advocate that the agricultural and the technical aspects of education should be kept fully in view of every elementary school and of every secondary school.

15705. Then the distinction to which Lord Belper drew attention does not affect your opinion really. Lord Belper pointed out that the Department of Agriculture and Technical Instruction had full control over agricultural education in Ireland, and you complained that the difficulty arose in England because there was a sort of joint control, whereas, if there is to be no technical instruction in the elementary and secondary schools the difficulty need not and does not arise?—I am afraid I do not quite understand the question.

15706a (By the Chairman.) Perhaps you had better go on with your evidence?—The next point is the local government of education. The Local Education Authority is the recognised unit for the local control of education. It has its finger in all educational activities which must be brought to bear upon the problem of affording suitable education to the community. If agricultural education is to become an object of national care—and everyone accepts that—it must be brought into the closest possible relation to the several aspects of national education. It must be developed on a basis which is capable of national application, and it must be developed as an essential element of a national system. The Local Education Authority has been established with a view of controlling and correlating all local education. The importance of its having direct relation with all education in that way is very obvious, and I do not think I need go into that unless there is anyone who wishes to ask me questions about it.

15706b Then one other matter is the constitution of committees. It has been said, and I have no doubt this Committee has had evidence before it to the effect, that a local education authority has too much to do, and that an agricultural committee charged with the duties of looking after all agricultural interests and education would be much better for that part of the work. Now, everyone will agree that it is most desirable, in developing agricultural interest in education, to have the continued attention of people interested in agriculture. But if these men in any area are segregated the work of general education, in which the agricultural interest in such an area as we are contemplating is of the utmost importance, is apt to suffer very seriously from the lack of continued attention on the part of those who are specially qualified to watch and to do good in the direction of that interest. To cut out the agricultural interests in any way (of course, it would not be an intentional cutting out, but it would be a very effective cutting out) from the region of general and secondary education in the rural community would, I consider, be a matter of the gravest misfortune.

15706c Then with regard to local finance. In finance we have to note the fact that rates are separate so far as elementary and higher education are concerned, and this separation of elementary from higher education in rating masks to some extent the unity of educational work. Of course, there are obvious reasons why they should be separate so long as one is compulsory and the other purely optional. That alone is a reason, but so far it is a misfortune from the point of view of appreciation of the relation of the different sections of education to one another; and really much of the education which is called higher in rural areas is in essence elementary. It is completing the work which the elementary schools are supposed to have done, but from various circumstances do not do; but it completes the work under conditions which make the methods, &c., and the matter of instruction, somewhat different. Besides the rates, the other funds available are those from the Exchequer Grant in Aid of Local Burdens, which is part of the common fund for the development of higher education, and which has to be applied in common with the rates for the general improvement of educational work.

Now the question of finance is always a difficult one, and the difficulty is very much increased where the people who have to allocate the fund are not interested, and interested with some personal familiarity, in all sections of the work to which they are called upon to allocate the money. The singleness of the aim of the system is one which ought to be clearly and plainly recognised by all concerned in the administration of the funds.

I have some other notes, but perhaps it would be better

now if members of the Committee would indicate any point upon which they desire any further information.

15707. I am sure the Committee have listened with the greatest interest to the very clear and exhaustive statement which you have made with regard to the steps to be taken towards the development of this problem of agricultural education. Now with regard to elementary and secondary general education, I do not propose to ask any questions except with regard to the training of the teachers for rural districts. You have pointed out to the Committee the difficulty found in obtaining those teachers in rural districts, and you have pointed out that as the teacher in the initiatory stages of his training does not wish to decide whether he will take up tuition in a town or in a rural district, therefore all that can be done is after he has been appointed to a rural school, to give him the opportunities of further training, so that he may have that special training which every teacher in a rural district requires. Now what I want to ask is whether any steps have been taken to encourage in the preliminary stages of training a certain number of scholars to enter for the special training adapted to rural districts?—The extent to which that can be done depends so largely upon the feelings of the local education authorities who are responsible for the training of the teachers that the Board of Education are able to influence it only indirectly. The way in which their interest tells most fully is by the importance they attach to those subjects in the training of teachers in training colleges which have a bearing upon it, such as nature study work, drawing, manual training and so on, and where they encourage training college instructors in those subjects to make the most they can of the teachers who show ability in that direction. The people who have taste in that direction are those who are most likely to be good teachers for rural areas. It is extremely difficult in the two years training of teachers, who have a good deal of work to do to get their general education up to the standard, to specialise them at that stage. Specialisation can only take the form of encouraging very good work in those teachers who show capacity for good work in their particular sections of their training that bear specially upon the rural interests.

15708. I gather from your evidence that you rather prefer the Scotch system, which has brought all these institutions under one department?—Yes.

15709. It is your opinion—whatever may be the opinion of the Board of Education—that it should be under one head. Your whole evidence clearly tends in that direction?—Yes, I am clearly of that opinion.

15710. Now you will admit we have to deal with a situation in which these higher agricultural institutions in England are under the Board of Agriculture, so that you do not, I suppose, advocate that they should be removed from the control of the Board of Agriculture and brought under the control of the Board of Education?—It might be the simplest solution now if that were done. I am not prepared to say that it would not.

15711. On the other hand, you are not in favour obviously of a dual control of those institutions?—No.

15712. You are not in favour of inspection by both Boards and of grants by both Boards to the same institution?—No; I think the duplication of grants and of inspection is unfortunate.

15713. Now, will you allow me to ask, if we are to draw the line anywhere, whether you do not think that the line should be drawn so that in any case where technical agricultural education is given quite apart from general education, it should not be within the province of the Board of Education to supervise it and to give grants, but within that of the Board of Agriculture?—Of course the difficulty is that it is so hard to say what is meant by technical agricultural work. I should prefer to see the work adjusted upon a general basis. You will gather from what I have said that in no other section of technical instruction does any Board other than the Board of Education deal with local authorities or managers of institutions in matters of education in relation to Government grants. The Board of Trade, for instance, does not supervise the commercial training of students. The Home Office does not supervise the instruction, or pay grants for the instruction of miners, or anything like that. But agriculture, I recognise at once, is treated somewhat specially amongst the industries in the British system. We have, and for obvious reasons, a Board of Agriculture which has got functions with reference to the industry of agriculture quite different from any function performed by a Government Board to any other industry in the country, and what I feel is this as to the industry: the preparation of

men to hold office in the industry, to perform work of any type for any grade in the industry, is a function of education, and if that preparation is to be provided in a teaching institution, then I think that that teaching institution ought to fall within the field of work proper to the Board of Education, just as the teaching institution for men engaged in engineering work or for commercial work does. The difference, however, between agriculture and, say, engineering, is that formal education in engineering has to be supplemented by an informal education in some institution conducted on a commercial basis; that is, that a man, after he has been in a college, or between times of college instruction, goes to work in a factory or in an engine shop, and so he is working in a business which is conducted for a profit and under conditions necessary to secure profit. The State does not give any assistance to the maintenance of institutions of that sort for the education of engineers' men in the duties of engineering, but in agriculture at the present moment the State does give that assistance in the case of farms—that is, farms where students may get experience in connection with work of an agricultural type conducted for profit and on a commercial scale. I certainly think that that is a special function that the State has undertaken, and as it is a special function it might perfectly well be, and more properly, perhaps, discharged through the special Board that attends to that industry. Otherwise I think that the work of education should be a part of the Board of Education's duty, of the Board set aside for educational purposes.

15714. I suppose you are aware that in most countries there is a Board of Agriculture, or Ministry of Agriculture, and that the Ministry of Agriculture deals with agricultural education?—Yes, but in most countries the organization of the educational work is very different from what it is here. The organization in England differs from that, we will say, in France in that the whole organization is a State organization in France, and in England a very large share indeed is a matter of local control; and the policy of England in this matter has been to develop the fullest possible measure of responsibility in connection with local bodies. That responsibility, as I have endeavoured to indicate, has of necessity done a very great deal to knit together the educational functions into a certain unity. Taking France, for example: in France, as we know, within the last few years there has been very great difficulty because of the Department which corresponds to the Board of Trade here having had supervision over certain sections of educational work, and the recent movement in France is in the direction of transferring from the Board of Trade and the Board of Agriculture all the educational functions which have been remitted to them. That is in France, moreover, where there is no difficulty about local control, and where the State runs the whole thing practically.

15715. Now let me ask you with regard to some of the institutions where overlapping occurs. Grants are made by the Board of Education and by the Board of Agriculture to the Cumberland and Westmorland Farm School, to the Basing Farm School, to the Eastern Counties Dairy Institution and to the Chelmsford Technical Laboratories. In those schools that I have mentioned the condition is not fulfilled which you impose for a grant, namely, that at least a two years' systematic course must be provided before a technical institution is eligible for a grant by the Board of Education?—In which school, might I ask?

15716. I have mentioned the Cumberland and Westmorland Farm School, the Basing Farm School, the Eastern Counties Dairy Institute and the Chelmsford Technical Laboratories?—The Harris Institute is the only one that is recognised under the category you have mentioned for grants.

15717. Under what category do the other schools come?—Those come under either Section 42 of the lower grade work or the Chapter 2 grants, which are substantially instruction given to people whose main occupation is something else than study.

15718. Now you will admit that schools of that nature (the Harris Institute, as you have pointed out, is of a complex character, and therefore I do not mention it) are distinctly technical agricultural schools, and does it not seem desirable, as long as the Board of Agriculture has control of the funds, that these schools should be under the absolute control of the Board of Agriculture and that the Board of Agriculture should administer the grants?—If these schools are under the Board of Agriculture, certainly; but the difficulty is that they are not. Taking the Eastern Counties Dairy Institute, the work on which we pay grants there is this sort of work—the butter and cheese school attended by students taking courses of work ranging over two weeks

to three months. These are all absolutely pupils under Chapter 2 of our regulations, and therefore there is a definite range of grant. In the case of the travelling dairy schools there is a 10 days' course, in which short local courses are similarly arranged in poultry keeping. The grant we paid to that institution last year in respect of these courses was £69—in 1906-7. That is for courses they had taken in that way. That is work not at all of the university college standard or advanced agricultural college work.

15719. Then your point is that all work which is not of university standard or agricultural college standard should be left to the Board of Education?—Yes, certainly.

15720. That is your contention?—I have no hesitation in saying that. There is no difficulty whatever about that. In fact, to take that work anywhere else, or to give national aid to that work, through anything else than the Board of Education, is to upset the whole system which has been carefully established by the Act of 1902. I quite admit that, if the Government in England were to take a paternal method, the bureaucratic method of giving a department, say the Board of Agriculture or the Board of Education, or a man, the power to establish schools for agriculture, such department or man would make a difference in 12 months that the existing system would not make in five years, but the permanent and ultimate effect would be much less. The method that has been adopted of developing public life in England is such that it aims at producing a fuller result by a longer time in education public opinion. Local methods are an essential element in that development, and that is correlated by the attitude of the Board of Education towards all that work.

15721. Therefore you assign to the Board of Agriculture only colleges—colleges like Aberystwyth College, and what we may call the higher colleges?—I do not say I assign those to the Board of Agriculture. I put it that those are required to be considered on a different basis from these others we are talking of.

15722. But I want to know where you draw the line?—I suggest that all these institutions, in so far as they receive grants in respect of education, ought to receive those grants through the Board of Education. I suggest that as to all these institutions, in so far as they receive grants in respect of giving special assistance to agricultural industries, whether by investigation or by affording facilities for work upon a commercial scale, or consultative work upon diseases or upon methods of cultivation, or anything of that sort, there the grant should go through the Board of Agriculture, but that all educational grants should go through the Board of Education. That is my personal view.

15723. That is what I wanted to know. Is your relation to these institutions confined, may I ask, to inspection or does the Board of Education guide the institutions in relation to agriculture; does it make suggestions with regard to courses of instruction?—The Board of Education is in this matter in a transitional period. Up to a few years ago the methods which were adopted did not succeed in doing much to develop this kind of work. The work is now being developed very rapidly. The Board has made such additions to its staff and is prepared to make such additions to its staff as are necessary to secure that all the work for which it is responsible shall be properly supervised. At the present moment we do advise and criticise every institution that is receiving aid from us, and we should not be performing our function properly if we did not do so. We should not secure proper expenditure of public money if we were not taking steps to exercise such supervision.

15724. Since when did the Board of Education begin to aid institutions giving technical instruction in agriculture?—It has been supposed to be doing it for 50 years through the Science and Art Department, but since when it has been giving effective aid is quite another affair.

15725. I am alluding, of course, to the grants to agricultural institutions, not to classes under the Science and Art Department?—It was only by grants to the classes under the Science and Art Department that the Government gave aid at that time. Take the Harris Institute, Preston. It received grants for classes under the Science and Art Department, classes in chemistry, classes in mechanics and classes in agriculture—and the school authorities piece these classes together to make the best sort of courses for which they could get aid, and it has happened that there has been a gradual development of the methods of the institution while the methods of awarding grants have perhaps only been slowly developed correspondingly. That is how it is.

Mr. F. G. Ogilvie, C.B.

19 Feb., 1908

Mr. F. G.
Ogilvie, C.B.
—
19 Feb., 1908
—

15726. Then before the grants were made, did the Board of Education institute an inquiry into the circumstances of each institution?—Yes. An institution makes an application to the Board of Education and states certain facts, and the Board consider whether they will recognise it as eligible for grants.

15727. Did the Board of Education consult the Board of Agriculture before giving grants to these institutions in the cases where they were aided by the Board of Agriculture?—I do not think we have given aid to these institutions—that we have begun to give aid to the institutions that were previously aided by the Board of Agriculture—without having such knowledge as the Board of Agriculture could give us. But we wrote to the Board of Agriculture and they pointed out to us that they gave a full account of their grants in the annual reports. I do not think in any of these institutions you have named we have begun to give grants under the circumstances you suggest.

15728. Then you admit that as regards practical agricultural education the active interest and the co-operation of the farmers should be obtained?—Absolutely.

15729. Has the Board of Education any machinery to secure that co-operation?—Precisely the same machinery that they use to elicit the co-operation of other members of the community in work in which their interests are involved. The Board work through the local authority. They act upon the local authority by inspectors of all types and by correspondence. They direct attention to the sections of work which require development and direct attention to the methods by which that development may in the opinion of the Board be most readily secured. The greatest prominence has been given in the last four or five years to the question of co-operation of employers. It has become almost fetish and has been doing a great deal of good. The attention that has been directed to the co-operation of employers has now spread into and has developed a most active influence in all the urban centres, and in the rural centres it is secured through the fact that the great majority of the local authorities are themselves engaged in agricultural operations.

15730. But have the Board of Education their own staff of inspectors—gentlemen trained at the agricultural colleges or the institutions with a special training for this purpose of inspection of agricultural classes and schools?—For the inspection of agricultural classes in rural areas we have several inspectors who are eminently qualified. For the inspection of agricultural colleges we have one inspector, but we have no work for him because, of course, we have no agricultural colleges with the exception of the Harris Institute and the one at Swanley.

15731. Now you mention in your statement travelling dairy schools and winter schools for young farmers. For inspecting these institutions have you got a skilled personnel which has special knowledge for dealing with such institutions?—Previous to last year there was but very little work of that type under the cognisance of the Board. Last year marked its beginnings. This year shows a very considerable increase in this work. The Board in certain areas have people who are qualified to direct attention to the weaknesses of the system employed in those particular classes and subjects, and they follow and will follow in this, as in everything else, the general principle that where expert inspection is required, if the staff does not include experts, experts will be employed. It is a regular part of the business of the Board to employ outside experts for any technical work in which inspection becomes necessary.

15732. Then in regard to these very special institutions like travelling dairy schools and winter schools, you are not prepared to admit that they would properly be under the control of the Board of Agriculture?—No.

15733. And you contemplate a further extension of the work?—I more than contemplate it. I say the extension is proceeding daily. Now that local authorities are alive to the position in which they may put things in relation to their work they are extending the field and volume of their operations daily.

15734. With regard to the work done at the various universities in their agricultural departments, what is their relation to the Board of Education? They get a Treasury grant?—Yes. It is given to the institution. The Treasury grant is given by the Treasury upon a report by an advisory committee. As to the expenditure of moneys all returns bearing upon or required for the consideration of university college grants are made to the Board of Education, and the Board of Education make the inquiries and provide some of the information necessary for the advisory committee.

15735. The committee which the Treasury consults is a committee appointed by the Treasury?—It is a committee appointed by the Treasury, but all the particulars as to finance which that committee requires to consider in advising the Treasury are provided or secured and systematised by the Board of Education.

15736. Do you mean to say that that Committee appointed by the Treasury sends its report to the Board of Education?—No; the Committee, before reporting to the Treasury, has to consider many things, one of which is the financial position and the statement of accounts and returns as to students, as to courses and subjects, and so on, in each year made by each college. Those returns are all supplied by the colleges to the Board of Education. The Board of Education puts them together, summarises them and inquires into them and presents for the consideration of the Advisory Committee a volume each year giving all these particulars for the year. The Advisory Committee has before it that information and also a report upon the work of each university college by inspectors appointed specially for the purpose every five years.

15737. Therefore the Treasury gets the report from this Committee, and also a report from you of the returns which you receive every year from these colleges?—Yes, the Treasury does, but the Committee, in making its report, has before it the annual returns provided by the Board of Education.

15738. That does include the agricultural department of the University of Cambridge, for instance?—No; Cambridge is not one of the university colleges.

15739. That is what I mean. Therefore you have no dealings with the older universities?—With all the universities, that is, all except Oxford and Cambridge.

15740. (*By Lord Barnard.*) In order to get it on the notes: you have referred to the department for which you are responsible, but I do not think, if I remember right, you told the Committee what that department was?—I am Principal Assistant Secretary for Technology and Higher Education in Science and Art under the Board of Education.

15741. You have also referred several times to rural schools in rural areas. I do not suppose the Board has ever been able to define a rural area or a rural school?—The definition would have to be a quantitative one, and it is a matter of considerable interest to attain something like a really quantitative measure of what one might call the rurality of an area. It varies so very much. It depends partly upon the distribution of the population.

15742. It is very vague?—Yes.

15743. The Chairman has already asked you some questions as to whether there are in your department any officials specially in touch with the agriculture of the community, and who are specially acquainted with the needs and businesses, I might say, which relate to the practice of agriculture?—Yes.

15744. But I rather gathered, though I was not quite certain, that you were not absolutely in touch with agriculture?—The Board has on its staff at the present moment one inspector appointed specially for service in relation to agricultural education, and that inspector does duty in various parts of the country. Besides that, amongst the many inspectors of the Board there are not a few who have considerable qualifications in one section or another of agricultural education, although they are not regarded as specialists. But then, besides that, again the Board does for special purposes in agriculture and in other things employ special outside men wherever they find it necessary.

15745. You are no doubt aware of the very great difficulty which has been experienced in the history of this question in acquiring the confidence of the practical agriculturist?—Yes.

15746. Then I take it from the very decided opinion which you have expressed that you are also of opinion that your department would obtain that confidence?—Well, that is rather a large order. I do not know that any Government Department ever did obtain the complete confidence of the community which it served, but I have not the slightest hesitation in expressing confidence in the belief that our Department will secure the confidence of those interested in agriculture in the administration of the work under its charge. I mean to say that the Department must. That is the long and the short of it.

15747. But what I want to put before you is this. Personally I have practical knowledge of the fact of the very great difficulty there is in securing the confidence of the farming classes, and to persuade them that by instruc-

tion you can teach them anything? You are aware of that difficulty?—Yes; and, more than that, I believe that it is not merely a difficulty of belief, but I believe that it is a difficulty of fact that by formal instruction there are many matters which cannot be communicated to an agricultural community. Many of the methods of improvement of their ability in their ordinary work must be communicated, not by formal instruction; and the difficulty of the want of belief to which you refer arises from what I certainly admit to have been mistaken methods employed by those engaged in what was called agricultural education in the past.

15748. You referred to the fact just now that for some fifty years, I think it was?—For a long time back.

15749. That at any rate for a great many years the Board of Education had been making efforts, or, rather, the Board of Education and their predecessors, had been making efforts to improve agricultural education?—Yes; to my knowledge for 40 years.

15750. Is it not the fact that it has been found out in some instances that the results of those efforts, in so far as the South Kensington classes were concerned, were not entirely satisfactory?—I quite agree.

15751. Then you have also no doubt got in your mind Sub-Section 2 of Section 2 of the Act establishing the Board of Agriculture?—Yes.

15752. Under that Act Parliament deliberately conferred upon that Board certain duties, such as the collection and preparation of statistics relating to agriculture and forestry, and it conferred upon them the power to undertake the inspection of and report on schools, not being public elementary schools, in which instruction in these subjects was going on, and the aiding of any school which admitted of that instruction? Are you aware of that?—Yes, I am.

15753. So that what I should like to ask you is, am I right in assuming that, in your opinion, that section of the Act of Parliament has made a great improvement?—No. I would direct your attention to the Board of Education Act of 1899, of which Section 2 is: "It shall be lawful for Her Majesty in Council from time to time by Order to transfer to or make exercisable by the Board of Education any of the powers of the Charity Commissioners or of the Board of Agriculture in matters appearing to Her Majesty to relate to education, and the Order may make such provision as appears necessary by applying to the exercise of those powers by the Board of Education the enactments relating to the Charity Commissioners or to the Board of Education." In my opinion, the time has now come in which the transference which Parliament in 1899 foreshadowed might take place.

15754. As a matter of fact, Parliament did very soon act upon the first part of those powers in regard to the Charity Commissioners—in the following year?—Yes, because there was no difficulty.

15755. How do you mean there was no difficulty?—Because the Charity Commissioners' work could be transferred as a whole, and with the staff which it employed.

15756. Pardon me for correcting you for one moment. I was employed on the Charity Commission for ten years, and I know there was considerable difficulty?—I ought to say no outside difficulty.

15757. You said there was no difficulty?—I meant no difficulty in connection with the local administration of it, because that is where the difficulty arises. In the case of agricultural education from 1899 onwards, it was prominent in everybody's mind that from that date a general re-arrangement of educational administration was taking place. That change took place gradually, and it was most undesirable to upset things during a transition period until the difficulties had so far cleared themselves.

15758. I should like very much to ask you, then, whether it is your suggestion that the whole of the powers of the Board of Agriculture should be transferred to the Board of Education under this Sub-Section for the collection and preparation of statistics relating to agriculture and forestry.—No, only those relating to education, and so far as they relate to education.

15759. Then Sub-Section 3 of the same Section is that the Board of Agriculture may make or aid in making inquiries, experiments and research, and collect, or aid in collecting, such information?—I think that that ought to remain with the Board of Agriculture.

15760. But those duties very much overlap at the present time, and you would still have a certain amount of overlapping?—I do not think so with those.

15761. Then am I also right in thinking that, in your opinion, there should be no dual control whatever, and that consequently the result would be that, so far as agricultural education is concerned, the Board of Agriculture would have no right to take any part whatever in it, except in the Houses of Parliament?—Yes, no right except the right which one Government Department has to approach another Government Department in anything that concerns it. It would be in precisely the same position with reference to agricultural education that the Home Office is with respect to the education of miners.

15762. But I think you yourself told us that agriculture is treated, on account of various circumstances with which we need not concern ourselves now, as being on an entirely different footing from mining or shipbuilding or the textile industries?—As an industry, yes.

15763. That may account for the fact that the Board of Agriculture has far greater powers and duties than the other departments concerned with mining and shipbuilding, say?—Certainly, that is so in regard to agriculture as an industry.

15764. It has been the work, has it not, of the legislature and public opinion for many years past to build up this Board of Agriculture; and is it not a fact that there is a movement at present on foot for improving the status of the Board because it has been felt to be necessary in the interest of the agricultural community?—Yes, I am aware of that, and that has my entire sympathy.

15765. To convey what I mean, you realise the fact that agriculture is treated exceptionally and in a different way from the other industries.—Yes, fully.

15766. Then with regard to duplicating grants, or rather to grants being made from the two bodies, is it possible that that system arises from the fact that the funds at the disposal of the Board of Agriculture are limited, and that in order to develop these institutions they must come to the Board of Education to get further assistance or they must curtail their work as the only alternative?—I cannot tell whether these institutions have been refused grants from the Board of Agriculture, but if any institution doing good educational work applies to the Board of Education, if its work were suitable under the regulations, it would readily obtain a grant. No doubt if there has been any difficulty at all in getting a grant from the Board of Agriculture they would certainly prefer to go where they would get the grant.

15767. I am afraid I have not made myself plain to you. You said you were not aware of cases where institutions have been refused a grant by the Board of Agriculture, but the point I put is that the Board of Agriculture having no more funds at its disposal, the only alternative was to go to the Board of Education or curtail the work?—Of course I do not know what the reasons or inducements before the board of managers of an institution might be, but I can quite realise the possibility of the consideration you mention being effective.

15768. Are you aware of the existence of the Dairy School at Worleston in the county of Cheshire?—Yes.

15769. Is it not the fact that that has actually happened there?—I do not know.

15770. I am told it has, but I do not know whether that had happened to your knowledge?—I never heard of Worleston having Board of Agriculture grants.

15771. It used to have them?—I was not aware of that.

15772. Perhaps I have misunderstood it. Then another subject which you mentioned was the question of county council committees. You are aware, of course, that in many counties in England, taking the county with which I am most familiar, the county of Durham, the mining industry and the shipbuilding industry prevail there almost exclusively, and that with an educational committee there you get very little representation of agriculturists at all?—Yes.

15773. How would you meet a difficulty of that kind, because there are a great many agriculturists in the county of Durham. The number is 11,000 males over 10 years of age by the census of 1901?—I think it would be desirable in a case of that sort that the local education authority should take some steps, whether by sub-committee or otherwise, to have the interests of the landward or rural part of the area kept before them sufficiently prominently.

15774. But would you do that from a central department?—No; we would make suggestions of that type to the several local authorities.

Mr F. G.
Ogilvie, C.B.

19 Feb., 1908

Mr. F. G.
Ogilvie, C.B.
19 Feb., 1908

15775. Now that leads me to another point, and that is this: These letters that you issue and this memorandum and the various documents appear to me to be rather counsels of perfection. They are what ought to be done and what might be done, but what steps are taken to give effect to them?—The steps I have indicated. In the first place you must place a definite and arrestive picture before a body such as a county council or the local managers of an institution or the teachers, in order to get them to realise that something may be done. If you look at each of these papers you will see that we most distinctly state that we put these things forward knowing that some at least of the points suggested may be adopted and worked up by the community to which we address them. We are careful to exclude the idea that we think for a moment that each county council should do all of the things, or that each schoolmaster can teach all of the subjects, or that each course should follow the lines indicated; but we give indications, knowing that each person has some chance of finding, or each community has some chance of finding, one or other or several of the points suitable for development.

15776. But it would be very difficult in a county like that I have named, where practically the agricultural interest, although it is numerous in the whole county, is in a minority in almost every parish—it would be difficult, or it would not be very likely that they would take very much action so far as agricultural opinion is concerned?—Suppose Durham applied for recognition under Section 34, whether we recognised it or not, we should draw attention to the want of attention that they were giving to this, that or the other section of their work, and we should suggest that they might do so and so, or take steps by committee or by appointing sub-committees and so on, to do whatever it is that is required. In each case that we deal with we give, after most careful inquiry, a reasoned statement of suggestions as to the special needs which may have been neglected.

15777. You know, of course, that one suggestion about an agricultural committee was not that it was to be constituted *ad hoc*, but what was suggested was a transfer to the committee which existed for the purpose of carrying out other statutory duties under the Board of Agriculture and it was suggested that they should also undertake these duties?—I am not aware of what suggestions have been made, but I quite see what you mean. You mean a committee like that having charge of feeding-stuffs or the diseases of animals.

15778. Yes, diseases of animals and small holdings would be of that kind?—Yes. I quite see a committee of that sort might very well be consulted by its council upon these specific points.

15779. I want to know now how you propose with your ideas to safeguard the interests of agriculturists and to ensure that the work which has been begun should be continued?—We propose to do that, in the first place, by doing the best we can to encourage, in every way possible, the development of public opinion and the realisation of the full responsibility that rests upon a local authority in respect of all things that are given into its charge. We do that by securing, before we make any general communication upon the work of an area under the local authority, a full report from inspectors, not one but several inspectors concerned in the matter, and we draw attention to every point upon which we are quite satisfied that the authority is not doing as much as it might reasonably be expected to do. By continuous pressure in that direction, and no sudden pressure, no putting on of the screw by us, but by gradual and continuous pressure as occasion offers and opportunity arises, we hope to continue to make the progress which has already been made.

15780. Would the putting into operation of the policy which you shadow forth involve any extra burden on the rates?—I do not think so.

15781. Then you refer to the fact of the transfer of certain colleges in Scotland to the Education Department of that country. Would you tell me from what they were transferred?—From the Board of Agriculture, with the grant of these colleges. That was transferred to the Scotch Education Department with those colleges.

15782. You also refer to an examination in agriculture. Is that an examination carried on by your department?—Yes, carried on by our department.

15783. Is it open for any student who likes to come up for it?—Yes.

15784. Where is that held?—It is held everywhere, at various centres all over the country. The managers propose to hold it, and it is held simultaneously.

15785. I think I am quite clear in understanding that your object is that the work of the Board of Education should develop the intelligence of the child, and should be a preparation for the work of life?—That is so.

15786. But you are aware, no doubt, that the efforts of the Board of Agriculture have gone a good deal further than that, and do you propose to take up that part of the work as well as the other part of the work?—It is the Board of Education who have been doing the further part of the work. That is only the child in the public elementary school, but you are speaking of adults. The Board of Education have been administering the national grants and giving such encouragement as national grants can give, or have been giving under the conditions under which they were awarded, for the development of further education in the agricultural community as well as other parts of it.

15787. Does the word preparation mean preparation as it is used in this memorandum as referring to the development of the intelligence? I am now differentiating between education and instruction which is only of any real value after the learner has been two or three years at work on a farm—that is to say, after education proper has ceased?—During those two years our principle is that what instruction is available should be given, not in agriculture, but with a view to adequate mental and other preparation of the pupil to understand agricultural education. That comes later.

15788. But I have more in my mind lectures which are given to, not the pupils or the students at all, but to the farmers in actual practice, not even necessarily young men, but perhaps old men, as to the development of the industry?—Quite so.

15789. Do you think your Board would undertake that duty?—We definitely give aid in respect of that. My point is that local authorities have not quite realised that that is of value, and have not yet done as much in the matter of pioneer work and lectures of that kind as they might have done.

15790. But it is done by the Board of Agriculture?—Directly?

15791. In departments aided by the Board; I think it is so. You are going to take this work away from the Board, and you accept the duplicate system which you yourself condemned.—I do not quite understand what work you refer to. Is it work in relation to explaining the new questions arising in local procedure, or methods of protection for their markets, and that sort of thing?

15792. No, that is not what I was thinking of. I was thinking of the result of experiments with grass plots, and that sort of thing, which lads, particularly lads who have not been actually engaged in agriculture, could not make a real use of.—I am not aware whether the Board of Agriculture has been doing that to any considerable extent, but I am aware that that is precisely the sort of function that is referred to and pointed to by the regulations of the Board of Education.

15793. I am somewhat surprised at your not being aware of that, because, speaking for the north-east of England, it is so?—You mean the colleges do it, perhaps?

15794. Yes?—I know the colleges do it, and I think it is an important function of the colleges, but I did not know you were identifying the Board of Agriculture with the colleges.

15795. In our case the agricultural department of the college is so identified?—It receives a grant from the Board of Agriculture.

15796. Yes, and it is inspected?—I understand so.

15797. (By Lord Belper.) A good part of your evidence-in-chief was directed, I think, to pointing out to us what was the policy of the Board of Education in regard to the development of an interest in agriculture in the first instance in elementary schools and afterwards in the technical colleges. Now as to the effect of what you are actually doing, I think you admitted that there was not so much actual work with regard to developing an interest in agriculture in elementary schools as there might have been?—Of course; it was not an admission, but I stated the fact that what is possible to-day in elementary schools depends so very largely upon the ability of the teachers to do the work that until the teachers have been fully apprised and informed on the matter we cannot expect to have it. What we do find is an improvement in that way.

15798. Practically, you said that the old teachers have not had a training which would qualify them to teach rural subjects?—Yes.

15799. Those were your words, I think?—Yes, that very many teachers had not.

15800. Then have the Board of Education taken any practical steps to insure that these teachers should have the training in those subjects which it is desirable for them to have?—The Board of Education has been taking very marked steps to secure that, but only of recent years.

15801. What marked steps have they taken?—By the encouragement of these supplemental courses of instruction for teachers in precisely the sort of subjects that are best qualified to improve their equipment for such work.

15802. But have they taken any steps to insure that these teachers should be trained in that way besides advising it?—The Board of Education have no power to compel a teacher to attend supplemental classes. They have done everything they can by grants and by bearing part of the expense and by pressing upon those who are responsible for the training of the teachers the duty of seeing to it.

15803. Have the Board of Education applied to those colleges which could give the training to know whether they could do it if funds were found and they would carry it out?—The Board of Education are not charged with that duty. The local authorities are, and the Board of Education endeavour to get the local authorities to do their duty in the matter.

15804. I understand the Board of Education give grants in agricultural teaching, and I understand that there are colleges which are giving that training by means of funds, but they are not much assisted by the Board of Education taking up that work, are they, although it is practical educational work in the interests of education?—I am not quite certain of the facts. There are a good many teachers' classes. Take a case like that of Nottingham University College. That is doing a good deal of teaching of teachers in this way. These classes are aided by the Board of Education for this purpose.

15805. Where?—There is the Nottingham University College. That is the one that occurs to me at the moment.

15806. I am aware that a great deal is done by the Midland Agricultural College, and that is done out of the funds of the College, but that is partly the work of the Board of Agriculture?—What was possible in one or two colleges out of funds provided by the Board of Agriculture is possible still, but I should say that if by exiguity of funds not much can be done by that college, more might be done in co-operation with the local authority with aid from the Board of Education.

15807. I think generally you are very strongly in favour of the system which would place the whole of the agricultural education under the Board of Education exclusively, and that both in the elementary and higher schools and colleges?—Certainly.

15808. And you instanced Scotland as an example of where that had worked successfully?—Yes.

15809. Then you came to Ireland, and, in answer to some questions by myself, you pointed out that the strength of the Irish system depended on the connection of the Department of Agriculture with technical instruction, and you said that agricultural education and the management of agricultural education in Ireland was done by the Department of Agriculture and Technical Instruction?—Yes.

15810. But their weakness was, you thought, that they had nothing to do with the elementary education in the schools?—Yes, and secondary education.

15811. Are you acquainted with the Irish system which has been built up within the last few years?—Yes.

15812. Do you know Professor Campbell?—Yes, I do.

15813. Should you not agree that the main point of the success of that work which has been done in Ireland was owing to the fact that the Department of Agriculture works with a thorough practical knowledge of agriculture itself, and that they are in complete touch with the agricultural interests in Ireland, and that by that practical knowledge they have gained the confidence of those for whom they are working?—I should agree almost absolutely to what you have said, but I would point out, in agreeing with that, however, that the circumstances in Ireland and the functions of the Department of Agriculture in Ireland are so essentially different from those that obtain in England, that only partially is the parallel one from which you can draw much.

15814. I admit that Ireland is different, of course, but, at all events, the parallel might go so far as to show that it is of paramount importance that those who are employed

in agriculture should have thorough confidence in those who direct agricultural education?—Absolutely so.

15815. You agree with that?—I entirely agree with that.

15816. Do you think, then, that a board like the Board of Education, which has got such an enormous amount of work as they have to do in superintending the general education of the country could acquire that practical knowledge and practical interest in the work of the agricultural classes which would enable them to gain the confidence of those for whom the agricultural education is given?—I say that the Board of Education must acquire, in one way or another, such information as is necessary for performing the function allotted to it. But in your question you omit the influence of the fact that the Board of Education is but one factor in the educational machinery of the country. The machinery for the administration of education in England turns just as much upon local educational authorities as it does upon the Board of Education, and it is the combination of the two which has to be considered—that is, a combination which does not remove from the Board of Education the necessity of having at its command adequate expert advice and adequate opportunity for becoming familiarly acquainted with the work being done in relation to the many industries of the country—a state of things which simplifies much the method of combining the whole educational interests under one Board.

15817. I fully admit that no Board could do it themselves without working and cordially working with the local authorities who have to do the local work, and without whose assistance it cannot be properly done, but I suppose you consider that the local colleges and institutions, at all events, as to some of them, must have a considerable voice in the successful management of agricultural education?—I say they are essential, and that is why I say they should be under the Board of Education. They are the key of the situation, I say.

15818. But are you aware that the whole of the evidence—I think I may say the whole of it—which has been given by those representing those institutions and colleges, so far as they have expressed themselves in the matter, has been in favour of the control of agricultural education being now handed to the Board of Agriculture?—I can very readily believe that, because I do not know from whom you have been receiving evidence, and I do not know whether the gentlemen who have been giving the evidence have taken the precaution of ascertaining fully the policy and the work of the department with which they have not had to deal. The Board of Agriculture has done excellent administrative work, and naturally men who have been working under it and have been satisfied with that administration do not see, from their own point of view, any particular advantage in taking the risk of transference. That of course is very valuable evidence.

15819. At all events you will go so far as to admit that those institutions are satisfied with their connection with the Board of Agriculture?—Yes, I have taken that from you.

15820. Do you not think it would be rather strong not only to take the whole of that work away from one department in order to give it to another department, but that that should be done when that other department has not yet proved by their practical work that they are in touch with the agriculture of the country?—A similar transference took place in Scotland five years ago with excellent results, under precisely similar conditions.

15821. That may be a fact, but it is hardly an answer to my question?—To this extent it is an answer, that one need not prejudice the case.

15822. Then with regard to finance, I do not quite follow what your great difficulty is with regard to the financial part of the matter. I think you put it as one of the arguments in favour of it all being put under the Board of Education that the financial difficulties were very great at present?—No, I did not put it as a serious difficulty, but what I did put was that the simpler the financial relations the more satisfactory is likely to be the expenditure of money, and that the money at present available for higher education is none too great, and that therefore it is necessary to see that any possible economy from complete co-ordination of work should be secured, and that the interest of those who are concerned in the expending of every part of the money should be a common interest.

15823. Why should not a Board which is thoroughly equipped, or which would be thoroughly equipped for the

Mr. F. G. Ogilvie, C.B.

—

work that they have got to do, and who are in complete touch with all the agricultural education that has been going on, and who also have practical knowledge of practical agriculture, be able to secure economy as well as the Board of Education?—I do not question that. But the point I make is that if you divide the money available into two parts you thereby diminish the economy of expenditure, because you have separate accounting and separate functions.

15824. I quite understand that a system in which you give the same institution grants from one public body and also from another cannot be helpful and that if you are to draw the line, you must draw the line in a different way. You must not allow them to overlap in that way. But who must decide which Board is to have the control of higher education?—But my point is that you cannot do that, because many of the institutions for higher education and for lower education have necessarily to give the education under both aspects. A great part of the evening class work is very complicated, and the services of the men on the staff, the instructors and all, ought to be available for all classes.

15825. I will not go into that question, but I do not think I am to be convinced as to any system in which work can be done in a more satisfactory way than it is now by taking it away from the Board of Agriculture?—Very well.

15826. (By Mr. Acland.) May I put a point that I do not think has been made quite clear; that is as to the newness of this development which you have been telling us of in the Board of Education. It is a fact, is it not, that given the grants for such subjects as you have described under the phrase "method and craft of labourers' occupations," the extensions of or aid to higher institutions beyond the subjects of the Science and Art Directory are comparatively of very recent growth?—Yes, they are.

* 15827. Nearly all you have told us of to-day has taken place since 1903?—But the point is that the Education Act of 1902 made certain things possible, and the Board has systematically worked towards making the most of that possibility.

15828. But would you agree to this, that a great deal of what you have described to us has only been made possible and has only arisen since the Act of 1902 came into operation?—Certainly.

15829. Therefore, there has hardly been time to judge of the success of all the new things which have started since then?—If I had been asked to give an opinion on the subject two years ago I should have had the greatest difficulty, but asked now I have no difficulty. The experience of last session and this session has gone very far to demonstrate that; it has gone far enough to satisfy me.

15830. Can you tell me what were the lines which influenced the Board in deciding to extend their aim for evening classes beyond such things as what are technically called science and art to crafts and so on—I understood that was a vexed question at one time?—It was the realisation of the fact that in many cases you could deduce the principles only through a certain amount of practice.

15831. Do you still retain as a sort of guiding principle that you will not give grants for anything in which there is not a principle of science or art involved?—I have not been able to discover anything in which there is not a principle of science or art involved.

15832. Therefore the subjects which are eligible for grants have extended very rapidly?—We do not talk about subjects. The field over which the grants are distributed has extended rapidly.

15833. Then as this development has been very recent, do you not hold that the very recentness of the development and the very recentness of the occurring of a considerable amount of overlapping constitutes a reason why it is possible to make a re-arrangement?—But there has been very little overlapping involved.

15834. But I mean the fact that it is very different now, that you could not aid hedge cutting classes and that county councils can aid them through money which they get under our direction, that is a very recent thing and it is rather an undesirable thing?—I do not quite understand about the county councils' aid under the Board of Agriculture.

15835. No, I suppose they do not, as a matter of fact, aid these things with money from the Board of Agriculture, but there is the fact that they come into the scheme of technical instruction, which is often under an agricultural committee?—What do you mean by often—I do not understand that. When you say often under an agricul-

tural committee, what distinction is there from being under an education committee?

15836. I think we have had evidence showing that the money spent by counties in aid of agriculture is considered largely as part of the money which they use for secondary schools and for educational purposes?—Yes, it is part of the general funds for higher education.

15837. And therefore there is as likely to be overlapping as your plan develops and begins to cover processes connected with agriculture between two states of the county council work at any rate, if not two activities of different Government departments?—I do not recognise the distinction of two states of the county council work, because I regard this work of further education of people already engaged in agricultural occupations as essentially part of the general work of the Board of Education.

15838. You think that you cannot draw a line between general education and the processes which are part of the trade or business?—Occasionally, in very definite classes—in dairying instruction—you can do that. But if the dairy process is to be improved it is quite necessary that there should be a full measure of improvement in the general education at that particular grade of the work as well as the distinctively technological work of making butter, and the two things are so interwoven that I can see no effective or satisfactory and clear line of distinction, and I think it would be most unfortunate if agricultural interests and higher education work should be restricted to purely technological work.

15839. In fact you could not draw a line of demarcation between such subjects as the subjects of agriculture which are very definitely educational, and subjects like dairying or thatching?—No, not a hard and fast clear line.

15840. You could not draw a line which would serve to differentiate the subjects to separate Government departments?—No. Between the two things you mention there is obviously a line, but the line is in subjects common to the two interests.

15841. You talk about higher elementary schools and secondary schools with an agricultural side, but you say that is a part of your work which is not at present fairly developed?—No, it is not at all developed, and the object of the Board publishing these suggestions of Mr. Dymond's at the present time is to direct attention to that particular field of educational activity.

15842. You find no difficulty in getting schools recognised as higher elementary schools that would have the higher grant?—Yes, if they satisfied the conditions. But the real difficulty has been with the people in the country—the teachers, the places and the managing authorities. They have not got a clear grip of what is required. That is the whole thing all along the line. As soon as they get a clear grip of what is required, then they can settle down and arrange classes for it. That is their relation to the work that I have referred to. That is the object of this publication that I have referred to just now, though it contains views upon many things in which there is no definite authoritative decision.

15843. But in old days it was practically impossible for any higher elementary school to be recognised as such unless it took the amount of science and art which would entitle it to be recognised as what we call a school of science. You do not find that difficulty now?—No. These regulations in the old days were part and parcel of a system in which everything was set down definitely. There was so much of this and so much of that. Now the Board of Education has worked away from that for several years, and the extent to which it has worked away is not yet fully realised, and we are doing at present very largely in the country a sort of pioneer business in trying to get people to realise that.

15844. So that if you put in a list of schools now recognised as higher elementary schools with agricultural courses, and a list of secondary schools with agricultural courses, that would not be representative of what you hope the development would be?—No, it would be very thin.

15845. So far as the reports you receive go, do you believe there is a considerable field for both those sort of schools?—I do, and there is a considerable feeling towards them.

15846. There would be no difficulty, so far as you are aware, as to their being recognised if that type of school comes into existence?—I understand the Board would welcome them.

15847. You talked, I think, of a block grant, that is, a block grant to a county for all its work of a certain type. That is obviously a very useful weapon, but have you yet

come to the stage of refusing, or making difficulties as to giving, that grant because you did not think the field of agricultural instruction was sufficiently covered?—Yes, we have.

15848. And you believe that to be a thoroughly useful power to have?—Yes, we have reached the stage of saying: this arrangement you put forward is not really a scheme at all. You have not touched the fringe of the needs of the community you are dealing with. You are dealing with a purely agricultural community, and you have made no provision except by means of a number of nature study classes, and some classes in wood carving, and some in arithmetic, and some in something else, but these have no particular relation to the work of your people, and unless you go back again and turn out a scheme making due provision for their educational needs we certainly cannot give you a grant at all—and unless it is a good one it will not be awarded much grant. We have reached that stage, and the effect is obvious.

15849. I understood from you that you did not see your way to drawing the line between one subject and another, these subjects being mentioned with regard to evening schools, but do you draw any line in higher institutions between the subjects which are connected with science and art and other subjects which you do not recognise as coming under your Board?—Do you mean higher institutions other than agricultural?

15850. Yes, other than agricultural?—We take cognisance of the whole of the work that depends upon the special object of the preparation of the students. Suppose it was electrical engineering, we take cognisance of his workshop work as well as his lectures or laboratory work.

15851. Would you definitely increase a grant because of good workshop work?—We should restrict a grant if there was not good workshop work.

15852. In fact, you do not say when giving a grant to institutions, to higher technical institutions: "This is in our province, and that is not," but you look at the whole institution?—Yes, we look at the whole of it.

15853. And similarly with higher agriculture?—We have not got cases of any higher agriculture grants, except to the Swanley Horticultural College and the Harris Institute but we have in those cases.

15854. (*By Mr. Lamont.*) I think from what you have said, you regard as entirely satisfactory the fact that agricultural education in Scotland is exclusively in the hands of the Scotch Education Department?—Yes, entirely satisfactory from the educational point of view.

15855. And from the agricultural point of view?—I think it is in the long run. It is possible that it may not be for the greatest immediate advantage either in Scotland or in England to make such an arrangement, but in the long run it is eminently so.

15856. You therefore regard the transference from the Board of Agriculture as having had, I think you said, excellent results?—Yes.

15857. Can you tell the Committee whether that is the opinion of agriculturists in Scotland generally?—I must now speak of the time five years ago, because I have not been sufficiently in contact with agriculturists in Scotland for the last five years to be able to give an opinion on that, but at that time it was clearly recognised that the absorption of the interests of agriculture in agricultural education by the Scotch Education Department, which took place then, was of great advantage in bringing together the whole of the agricultural bias or aspect of education in the different sections of the work carried on by the Department.

15858. You have not heard it suggested that the result might have been more satisfactory still if the control of agricultural education, instead of being transferred to the Scotch Education Department, had been transferred to a Sub-Department of the Board of Agriculture, sitting permanently in Edinburgh, not an independent Board of Agriculture, as proposed at present under the Government Bill, but a Sub-Department of the Board of Agriculture?—No, I have not heard that suggested.

15859. We understand, and we have it in evidence, that agricultural education in Scotland is practically confined to the three great collegiate centres of Edinburgh, Aberdeen and Glasgow?—Higher agricultural education is certainly so restricted, but I do not know that the agricultural interest in education is not as wide as the country.

15860. Quite so, but the education itself is?—Formal agricultural education of the highest grade is restricted to the institutions in those three places.

15861. Can you tell me whether in any case those three institutions own a farm?—One does—the West of Scotland College. *Mr. F. G. Ogilvie, C.B.*

15862. It has the right of entry to a farm?—Yes, it has that relation to a farm. *19 Feb., 1908*

15863. Can you tell me anything as to the position of Scotland relatively to England with regard to intermediate agricultural education?—I do not know that I ought really to speak of that matter, because my information is not of the most recent, but in case it should be of value, and with that restriction or observation, I can give you my view on the matter. I say that in Scotland you have a very large proportion of teachers in the better parish schools, who have themselves had from boyhood intimate acquaintance with agricultural affairs, who have had during their life close contact with people who are carrying on agricultural operations, and are themselves therefore, in complete sympathy with, and who have very considerable knowledge of agricultural matters. These men are relied on by the education authorities to keep well in view the ultimate occupation of the majority of their pupils in the schools, and their own personal knowledge of subjects as are most likely to be suitable vehicles for education in the elementary school has been systematically improved by the Scottish Education Department work under Section 91 (d) of the Scotch Code, 1906 (now transferred to the Regulations for the Preliminary Education, etc., of Teachers).

15864. But that would be rather more parallel to nature study in England, and to the teaching of natural science in the schools, than to the question which I more directly ask, that is, the position of the intermediate agricultural education you have in Scotland to deal with this essential point of difference as compared with England, that the secondary schools have been for generations in direct relation to the bulk of the people, and that therefore a pupil who is going forward for further education is far more likely to have a secondary school education in Scotland than until quite recently would be the case in England. The point of importance in the agricultural connection with intermediate secondary schools in Scotland is that those schools now provide a very thorough and almost universally very thorough training in Science and in drawing, as well as the usual literary and mathematical instruction necessary. So that where a farmer's son is sent on to a secondary school, he does get in that secondary school quite certainly the sort of preparation necessary for his going on to the agricultural college. Further, there are certain central schools in agricultural districts where there is given definite prominence to those subjects, that is, to the training in science, and to its bearing upon such work as the students are likely to require, and in that respect Scotland has reached a little further step along that path than England yet has. Therefore, you have a more complete adaptation of secondary education to the needs, but not to the technical needs, of the agricultural students. But that is of less importance, because wherever you have got a student who is likely to be going forward on that line in Scotland, if he is in the least likely to benefit by higher technical education in agriculture, those responsible for him, parents and guardians, and so on, are quite prepared to send him to an agricultural college.

15865. Then you do not think there is room in Scotland for the development of farm institutes or for schools on the lines of Basing, or Ridgmont, or Newton Rigg, for the sons of farmers, or for people desiring to enter farming, but who do not see their way to go on and take a full university course at a centre?—When you speak of an agricultural college in Scotland, I may say you may have a complete course, and there is also facility for students taking shorter courses.

15866. For a year that is?—There is a definite arrangement for a year's course, say. Of course a good deal depends on the type of farming for which the man is intended, and it is a question on which I have no sufficiently informed opinion to quote as to whether in Scotland there is a need for anything between the winter courses for small farmers' sons who during a great part of the year may think of taking a winter course for one or two years, and a complete course. It depends very largely upon the type of work and the class of man the education has to be provided for. But that is the first duty of the organising authority—to make up its mind as to in what sections of the community there is really a demand, and what is the type of instruction most suitable for those sections. I am not prepared to say whether the winter

Mr. F. G.
Ogilvie, C.B.
19 Feb., 1908

course, on the one hand, for the smaller farmers' sons, and the two or three years' course on the other, for those who are prepared to go on and take a longer course, as between them do not cover the whole ground. I do not mean not with individual exceptions.

15867. I hardly take that view myself of Scottish agriculture. I think the Scottish farmers would appreciate it very much if there were such schools as Basing scattered throughout the country, where their sons could take a complete winter course or a short course without going a long distance out of their own particular farming district to, say, Kilmarnock or Aberdeen or Edinburgh?—I could quite believe that might be true, but I am not in a position to give an opinion one way or the other.

15868. Then I should like to ask a few questions with regard to lecturers and lectures in Scotland. Was it your experience up to five years ago that the lecturers as a rule in Scotland had won the confidence of the farmer to the same extent as that in which they have won it in England?—They were only just beginning. It had been systematically going on for about four or five years at that time, beginning about 1898, if that is on a sufficient scale to test it. They had very largely won the confidence of the farmers. The lecturers are referred to as county lecturers. To take as a typical case the East of Scotland, the Agricultural College there had a staff, and that college received subsidies from all the south-eastern counties in Scotland, and in respect of receiving those subsidies it sent its lecturers to a certain number of centres that formed a part of the organisation. Those lecturers took up the work of pioneers in agricultural education generally, and specialists at farmers' clubs and institutes on market days, and they advised the teachers of the elementary schools as to how they should do this, that and the other thing, and worked with them upon evening classes, and visited the evening classes. They worked with them, and worked the teaching in, and so on, until generally the college became the central point of things for the area to which it was attached. Those lecturers did rapidly acquire the confidence of the farmers. The lecturers were not merely the college staff, though they were sent by the college. They might be lecturers whose time was not required by the college. It might be a veterinary surgeon, or a professor of anatomy, in the veterinary college, who might go down and give an occasional lecture in two or three places at the instance of the college.

15869. My own experience of the West of Scotland, of Argyllshire, with which I am most connected, is that those lecturers have not as yet excited any interest or any confidence amongst the farmers, and at the last lecture that was given in my own district the total attendance was only two, one only of whom was really directly connected with agriculture, so that I think there is still room for fostering the confidence of the farmers and for developing their interest in this work?—May I say in reference to that difficulty, which is not uncommon in these things, that the whole point is the personality as well as the knowledge of the lecturer. You may have a man who knows all about it, but who cannot put it in an interesting way. The difficulty of the teacher is the crucial difficulty from top to bottom of this business, and if you cannot get a good teacher you are throwing the money away. There is no doubt about that, and I suppose every college, and institution, and county council, has had its unfortunate experience in that respect.

15870. I agree very much with what you have said just now, that the elementary school teachers in Scotland, to a greater extent perhaps than in England, have a hereditary interest in rural affairs, but can you tell me whether in Scottish elementary schools hitherto history has been taught with any bearing upon agriculture or even any bearing upon rural elementary economics?—I should like to say on that that only in individual cases do I know that that has been so, but I may also add that the subject of the teaching of history has been made the subject of special inquiry, and just recently, of special advice by the Scotch Education Department. They have issued a most able pamphlet, which one would hope to see produce a marked effect. It is in that kind of way that the Department, appreciating weaknesses, can gradually give strength.

15871. The teaching of history of this kind is having a most excellent effect in Denmark. and one may hope it would have a similar effect in Scotland?—I quite agree.

15872. (By Mr. Latham.) I think you told us that for a very long period certain things had been done for the

benefit of agriculture prior to this date. What has it been?—I do not think I quite put it in that way, but that certain efforts had been made with a view of benefitting agriculture.

15873. Whether anything has been done, or only efforts made, what have been the efforts?—The old Science and Art Department established a system of grants upon passes in examinations in agriculture. They sent a lecturer to go over the country and endeavour to arouse enthusiasm in this matter. He did arouse a good deal of enthusiasm in many places, and he had schools started and teachers set to work, but the question of how far the classes were beneficial was quite another affair, for it turned again upon the teachers, and it now appears that the effect of the work done on those well meant lines was not sufficient to justify its continuance.

15874. About what date did that begin?—I do not know. I know that these influences were at work in Scotland as long ago, I think, as forty years; and I should think in England, nearer the headquarters of the Department, they must have been at work before that.

15875. But you do not know?—Say 50 years ago—that is near enough.

15876. Do you really mean to say that there has been a great endeavour by the Board of Education to take up agriculture for 50 years?—No, I say that the Science and Art Department made such effort as it thought itself justified in doing with the funds it had, and with the wisdom it had, to organise some 50 years ago. The Board of Education is only a few years old, and its efforts are quite different.

15877. But if it is only a few years old, has it, during its life, made any speciality of agricultural education?—It has. During the first years of its existence it made a special study of the conditions of agriculture; and during the last two or three years it has made special efforts to get local authorities and those taking part in agricultural education to put their work on good lines.

15878. Has that been successful?—In the places where the community have taken up the matter it has already achieved considerable success, and that success is promising to increase.

15879. But there is no pressure put upon local authorities by the Education Department, is there?—I do not think, as an official of the Board, I should say the Board puts pressure upon them, but it puts considerable inducements in the way, and endeavours to persuade them.

15880. Can you tell us what the inducements are?—The offer of grants in aid of instruction carried out on certain lines; the advantage of suggestions or details of the methods of application of grants, and the assistance of inspectors in organising work, or in discussing special methods for adoption.

15881. Is there any criticism on the several authorities that do not do anything?—Yes. When an authority puts itself in the way of having its scheme considered as a whole, the Board of Education criticises the scheme such as it is, or the absence of scheme if there is no satisfactory scheme.

15882. Does it pass a vote of censure on them?—No, it does not amount to a vote of censure. It is not quite the practice in England to expose local authorities to votes of censure from the Board of Education.

15883. Then there really is nothing done by the Board of Education to promote agricultural education under pressure?—Under pressure?

15884. Under pressure?—Well, yes, under pressure of the general kind which alone is available; for the Board of Education has got no statutory authority to press.

15885. Was it the Act of 1889 or 1899 that you quoted just now—was not that the time when technical education was being discussed?—The Board of Education Act was in 1902.

15886. That is secondary education; but was not there a Technical Education Act in 1899 or 1899?—There was an Education Act, but there was no authority under that Act. Under that Act all they had to do was as successors of the Department of Science and Art, to authorise the expenditure of money by the counties or by the authorities upon specific subjects named. It fell to the department to say whether a certain subject might be approved as a vehicle for instruction under that Act.

15887. But did not the education authority prevent that Act being carried out by county councils?—Not to my knowledge.

Mr. F. G.
Ogilvie, C.B.
19 Feb., 1908

15888. We were prohibited from giving prizes in the show yard and different things through the education authority?—I was not aware of that.

15889. Now I see in this book of yours, which I cannot help saying I am very glad to see, that you advocate a good many of the things that we were prevented from doing then?—That shows we have been advancing in wisdom as we have in years.

15890. But have you at the present time put any of these things in operation?—Our business is to encourage the local authorities to put them in operation.

15891. Yes, but they will never do it without pressure being put upon them.—Whenever a local authority gives us an opportunity we act. We sit here watching for opportunities to put pressure on, and whenever we get an opening then we put on the screw.

15892. I want to ask you rather a pertinent question. What has the Board of Education ever done to assist agriculture?—I have been trying to explain for the last three hours the various matters in which we have systematically set ourselves about to do it.

15893. But has it been successful?—Very successful in the quarters where we have received sufficient encouragement, and in the other quarters we have got to take those methods which are proper, as I have explained already, to a Government department acting under legislative conditions.

15894. I dare say you are very well aware that there has been very great feeling by agriculturists generally about this education question?—About some parts of the education question I am aware there has been very great feeling.

15895. Do you not think, if you attempt to take this away from the Board of Agriculture, that agriculturists will resent it very much indeed?—I do not suggest that this work in the rural areas should be taken away from the Board of Agriculture. I suggest that the work which is being done under the Board of Education in the rural areas should be extended and made more useful and made firmer in every way.

15896. But you are not going to teach much agriculture in elementary schools, are you?—I should not think of attempting it.

15897. Why?—Because I do not think it is a good thing to try to teach agriculture in elementary schools.

15898. Do you think these lads will do much agriculture in higher schools?—I should hope they would.

15899. Have you had any experience of it?—Yes.

15900. And you have found these lads, after a certain age, are willing to be taught agriculture?—Yes, and I should go further and say that any attempt to teach them agriculture in elementary schools would do a great deal of harm.

15901. In what way?—Because it makes them imagine they know things when they know nothing about them whatever. They are too young to understand anything which is actually essential to agriculture. They can quite understand and appreciate many things which help to form their minds in the directions that enable them to follow agricultural instruction later, but to give them technical instruction of an agricultural kind, under the ordinary conditions of elementary school work and under the ordinary conditions as to remaining at school that hold in the different elementary schools in rural areas, would be ridiculous in my opinion.

15902. But these lads are kept there till they are 14 years of age?—No, they are not, or very few of them.

15903. A great many round my district stop there till they are 14—they are kept there or they stop there?—That is, unfortunately, a rare experience. The number of pupils in rural districts over 12 is very limited, taking England as a whole. If you take a large number of counties and you take the number of those remaining over 14 they are few. I am talking of the instruction that is purveyed as that described by me and described in the Suggestions for Rural Education.

15904. But if they are to be asked to attend these evening classes, do you not think they will want to have the beginning before they leave the elementary schools?—Yes, certainly. I think it is most desirable that they should have the beginning, but the beginning could not in my opinion take the form of teaching any agriculture.

15905. How are these lads to take any interest in agriculture if they are not taught it in the schools?—I am afraid that the difference between you and me is one

of definition. I was thinking of agriculture as a specific and technical occupation; but from that last question I think you must be looking at it in a wider sense, and taking agriculture to merely mean matters of rural interest. If that is so I think that is most important that in elementary schools the attention of the pupils should, be directed towards matters of rural interest. Their intelligence should be developed through that. If that is not done I consider that they are very much less well prepared for subsequent work in agriculture than they ought to be.

15906. To go to a very old subject, everyone now tells us about their anxiety about the people leaving the land. Do you not consider one of the greatest reasons is that the children are taught no agriculture whatever in their schools, and that when they leave school they are vastly more fitted for commercial life than they are for agriculture?—I think that has something to do with it, perhaps, but I think it is by no means a deciding influence.

15907. But do you not think such things as plant life and interest in animals and that sort of thing might be taught very well in the elementary schools?—Yes, certainly.

15908. That is agriculture surely?—I thought we were not talking about the same thing. I do not profess to know about agriculture; but I take a great interest in all these things, and that is, I think, essential for those living on the land, undoubtedly. It is a matter of general education, and it is in that direction that one can help to promote general culture and knowledge.

15909. I very much agreed with what you said about the ignorance of teachers with regard to agriculture. It is lamentable to know how little in an evening school they know about it; and how is that to be improved?—Am I to take the wide definition of agriculture that I understand you to take?

15910. I am an agriculturist myself, I had better say?—Yes, I know, and taking the wide definition of interest in rural matters to be agriculture, I think it is to be improved most directly by the influence of these vacation and Saturday courses and that sort of thing. In the case of teachers who are at the present moment engaged in the work of elementary schools, they, by the help of the expert teachers of agricultural subjects who are sent round, might become more or less interested in such education in their districts, and taking those influences together and singly, one might hope in time to make a very considerable difference in the matter.

15911. A great many of these elementary teachers have got a great deal of their education in elementary schools, have they not?—The beginning of it, yes.

15912. Would it not be a very good thing if these men and women who are likely to be teachers should be taught a certain amount of agriculture in their earlier days?—Yes, the rural interest ought to be developed.

15913. (By Mr. Lamont.) That is suggested by Mr. Dymond?—Yes.

15914. (By Mr. Latham.) I am very much afraid that if you take very much of the agricultural education from the Board of Agriculture you will absolutely stop agricultural education altogether?—What I am putting is my own clear opinion, which is that it is most important to have this interest inculcated in the elementary schools. If you trust to this being done by a Board which has nothing to do with elementary schools you will trust to a broken reed. If you are to get it in the elementary schools at all, you must do it by the Board which has the effective control of these schools, and you must do all you can to strengthen the hands of the Board.

15915. That is putting the cart before the horse. Should not the Board interest themselves in it?—But they do.

15916. But they take no interest at all, as far as I know, in agricultural affairs?—I have a little more intimate knowledge on that matter.

15917. I do not think you realise the fact of how very little the meaning of the word "education" is understood in the country; and if you go and put it all under the Board of Education instead of under the Board of Agriculture I am quite satisfied it will drop out?—That may be so.

15918. Let us go as far as the secondary schools. I think you said just now you did not wish agricultural education to be taught there?—No, I did not. I was talking of the Scotch schools and the Scotch Education Department. I think the precise manner in which agricultural teaching should be limited in intermediate education, whether in secondary schools or in higher elementary schools, depends entirely upon the conditions

Mr. F. G.
Ogilvie, C.B.

19 Feb., 1908

of the neighbourhood. The conditions of different regions of England are very variable, and what is good in one region may be not so good in the next-door region, and because of that I say the Board of Education have, after considerable inquiry and much careful discussion of the matter, put forward with general approval the suggestions which are drawn attention to in Mr. Dymond's paper, which covers several different lines of correlated work, and where in a certain section of the country one thing is dealt with and in a second section another, and so on. In some parts secondary schools ought to have definite relation to agricultural work, but in others it is not only unnecessary, but undesirable. It entirely depends on local conditions.

15919. If these lads are not taught something about agriculture before leaving the secondary schools, how are you going to teach it to them afterwards?—Any lad who would not be taught anything relating to agriculture in a secondary school would still have had a training in science and in drawing, and language, and so on, which would be the proper basis for his further work in an agricultural college, and would enable him to approach with a wider outlook that work which he would be getting to do on his father's or somebody else's farm at such intervals as he had, whether before or after going to the agricultural college; and he would, therefore, have supplemented an interest in agricultural subjects by all that would be necessary. If it were the case of a lad not in an agricultural college, then he ought not to be taught at a secondary school of the type I have just described.

15920. I have heard nothing about scholarships. Do you advocate scholarships being attached to these centres that would enable a lad to get to a college?—Certainly. The relation between the schools of various types must necessarily be either a matter of the payment of railway fares, where necessary, or a supply of scholarships of various grades and amounts according to circumstances, each case being considered by itself in each locality as to distribution of centres of instruction, and each case of need for different types of instruction being considered on its own bottom. If you look in that Form 906 it gives a sort of detailed suggestion about the kind of organization suggested by the Board, and you will see we attach considerable importance to that.

15921. Then these scholarships would be attached to secondary schools, to be won by certain pupils who will go on to certain colleges in different localities?—That would be one of many arrangements possible in certain types of locality, but not in all.

15922. Not in all?—Not in all.

15923. I suppose agriculture will be represented in all localities; and how are the boys to get the instruction if there are no colleges?—There the systems of agriculture and farming, and many other things, affect this question, and the conditions of different localities, which vary greatly in these respects.

15924. Would these scholarships be offered through county councils or by the Education Board?—That is a matter of detail.

15925. I understand it is detail, but it is a matter of great interest to the pupil?—If all the pupils of the particular area considered it necessary to pass through a particular school on their way to college, and if the particular school was the only avenue from the county to the college, the scholarship should be awarded in connection with the school; but if the Local Authority had to deal with several such avenues, they would have to make arrangements to make their award common to several schools. That is what I mean by detail.

15926. Then do you suggest that you should give grants to the different colleges?—That the Board of Education should give grants?

15927. Would the Board of Education give grants to the different colleges?—My suggestion is that the grant given on behalf of the Government to the colleges should pass through the Board of Education.

15928. Have you done anything at all towards assisting veterinary science?—In respect of the teaching of lower grade work in veterinary science, farriery and matters of that sort, and such like information on the needs and interests that exist in the matter of the hygiene of animals, the ordinary arrangements for aiding the local classes hold good, and have been taken advantage of, but in respect of higher veterinary colleges, no. We have not been called upon to give any aid in that respect.

15929. Do you think that desirable or not?—I think veterinary colleges are central institutions, and are certainly useful. They are technical institutions.

15930. Notwithstanding the existing controversies of the present day they are very essential for obtaining the highest knowledge possible?—Yes, they are in precisely the same position, in my opinion, as medical colleges. The Veterinary College in London and the one in Liverpool are precisely in the same relation to the State, as regards the need for state aid, as medical schools.

15931. You talked of experts in agriculture once. What do you mean by that?—I should have said, perhaps, experts in some section of agricultural knowledge, but I forget in what connection I mentioned them.

15932. You made some allusion just now to types of farming. What did you mean by that?—Sheep farming and stock raising, and so on.

15933. As taught by the Board of Education?—No, as practised by the farmers of the country.

15934. What has that to do with agricultural education?—It has a great deal to do with it. If you are going to train a man to be a sheep farmer it does not require quite the same sort of education as if he is going to be growing crops—where, for instance, wheat and roots are the main thing.

15935. I think you are now getting into practical agriculture. I do not know whether you are likely to take up the teaching of practical agriculture?—I have no such intention.

15936. What did you mean by agricultural bias?—Keeping continually in view the fact that the education that is being supplied to a pupil should have some relation to the interests with which he was afterwards to be connected, those being agricultural.

15937. Having taught all these things now, and all you seem to wish to teach them, shall you be surprised if they do not become agriculturists after all?—I should not be in the least surprised if that was all they had had, but all the work that I have been talking about to-day has been considered as a part of a general education. The other and main part of it was obtained on the farm.

15938. One word more with regard to lectures in respect of which you say you have had a great deal of trouble in providing lecturers. How have they been supplied?—Purely by the county authorities taking pains to secure good men who knew something of the practical work of agriculture, and who had added to that scientific training sufficient to enable them to enter into the principles of it, and to communicate those to the pupils.

15939. Now where have they come from?—Some of them have come from agricultural colleges, and others of them have been men who have had a fair education, and have had very good practice in their own work in the country, and who have added to that careful study of scientific principles in evening classes or in short courses.

15940. Have they got their education through the Board of Agriculture?—They have got their education partly at schools aided by the Board of Education. Many of the best of these teachers have received their education in evening classes, and have added to that, perhaps, a short term at the college.

15941. Farmers are rather a peculiar people, I am willing to admit, and if you send a man down to lecture a farmer, in all probability the farmer will teach the lecturer more than the lecturer will teach the farmer, and therefore I do not wonder at the great feeling against them?—I do not think farmers are peculiar in that respect. Any practical man can always give more than he can get in certain aspects of the work with regard to teaching.

15942. Yes, but some of these teachers teach farming and they are not very well up in it, and where do they get the science from?—If it is desirable to teach science to a farmer it is desirable to do so wherever he has got his knowledge from, and if he has got it in classes and has also been engaged on the farm he would be the last type of man I should expect the farmer to teach much to. The man who would be taught much by a farmer would be the man who had not much knowledge.

15943. (By Dr. Somerville.) I suppose you are debarred by statute from aiding such an institution as the Royal Veterinary College?—I have not inquired into the matter. I do not know what statute at the present moment would debar us. If the Royal Veterinary College applied for aid I should inquire into it, but I cannot say at the present moment whether we are debarred or not.

15944. We have had it given in evidence that the Royal Veterinary College has been struggling against difficulties for some years and last year the Board of Agriculture gave it £800, and I should like to know why the Board of Education, with its more ample funds, did not aid this important institution, unless you are debarred by Statute?—I should say, first of all—and it might be quite a sufficient answer—it was because we were not asked; but further, as I say, I do not know about there being any necessity. It depends entirely on the conditions of the college charter, and so on. The only thing that I can think of as debarring us in such a matter would be that the school may not be suitable in character and financial position to receive aid from the Board. To receive such aid it must not be conducted for private profit or farmed out to profit. There are many other conditions, but that is the one that generally hits most cases of the kind.

15945. Apparently, at any rate, the conditions had not been such as to prevent the Board of Agriculture stepping in to aid it?—No.

15946. Then I think you have said that the Board of Education, if it found that a scheme submitted was not suitable to the requirements of the locality, would send back that scheme with an indication that a new one must be prepared better adapted to the wants of the people?—Yes. Such action might be for two things. When we receive a scheme, we may say, This is a scheme which we cannot accept, and we point out the matters in which we think it defective; or we might say—and this is the more frequent case—We think that that is good enough so far as it goes and we will give you a grant of not less than so much, say £1,200, for the work which you have set forth that you are prepared to do. If the work at the end of the year is found to have been better than we felt that we could count upon its being, we will give you a larger amount, and we draw your attention to the following points in the scheme which appear to us to require amendment or improvement; and then we detail a great many points. Some of these are points which can be set right in the course of the year, but more probably they are points which we want the authority to keep in view for the next year's scheme.

15947. Are you now speaking of your relations with the county education authorities?—Yes, what I have just said refers only to cases where we are put into a position to consider the proposition for the county as a whole. That is under section 34. Previously to the establishment of section 34 we had far too light a hold upon the organisation. Our grant had to be made entirely in respect of separate schools and it was too difficult for us to press for organisation. That is the object of the section.

15948. Have your relations been altogether with the county education committee or do you come into direct relationship with the still more local organisations?—We may give grants to a school not working under the control of the local education authority at all, but the great majority of our schools are working under their control; and almost all of them, if not working under their direction, are with the approval of the local authority covering some particular section of the field of work which is properly taken account of in the organisation within the area.

15949. Then do I understand that the schemes that are submitted to you come from this large county education committee?—Yes.

15950. This county education committee making itself responsible for the details of the scheme for each particular parish or other local unit within its area?—Making itself responsible for the general arrangement and for the provision for the area as a whole. But we have to press—and it is a case of having to press—for a fair amount of responsible influence being given to local managers in connection with the carrying on of such work. In the separate parishes we regard it as of the greatest importance that those specially interested locally should have some responsible duties to perform in connection with it.

15951. Then I take it you come in contact with the managers of local schools through your inspectors?—Yes.

15952. But that you do not hold communication with the managers of local schools as regards their local schemes?—Not directly, but we should if it were a school that was simply working in the area of the authority, but not a school carried on by the authority. In the county areas, the rural areas that is, a very large part of the best work from the point of view we are discussing to-day is now carried on by people directly paid by the county authority, but much of it is still carried on by people who are not

paid by the county authority but for whom the local managers are financially responsible and with whom, of course, we have direct relations, subject to the condition that the local authority knows the position of the school in relation to the general scheme.

15953. Then, I suppose, if you had a report from an inspector that the work in some particular school was not in conformity with the requirements of that particular district, you would bring pressure to bear, I presume, upon the county education committee or authority?—Yes, and on the local managers, if there were local managers who had the effective power of the purse.

15954. Upon the local managers—would you actually go to the county or go direct to the local managers?—It depends on the precise relation that has been established in the district. We prefer to have our arrangements made through the county authority.

15955. But you would not, I suppose, send an inspector or an expert to consult with and confer with and advise the managers of any unsatisfactory school?—Oh, yes, certainly.

15956. You would have such close personal relationship as that?—Yes.

15957. But you have already said you prefer to work through the county committee?—Yes, on the general question of the supply of education over the area, but then, when it comes to getting a particular school to do efficiently the work that is committed to that school, we could not trust to following the suggestions through a long chain of people.

15958. In the statement you were so good as to submit to the Committee you indicate, of course, a few large sections into which education of an agricultural character falls, and I suppose we may conclude that a great deal of this rural education is conducted through classes meeting two or three times a week, during the day or in the evening?—Yes.

15959. I suppose that comprises the bulk of the work?—That is the bulk of it.

15960. I suppose that these classes are to a large extent guided by the syllabus set out under Subject XXIV.?—No, a comparatively small number follow that syllabus.

15961. For whom is this syllabus particularly intended, then?—It is intended rather for those who are giving more continuous attendance to, and who are prepared to undertake a course of fuller scientific preparation than is possible for the average rural evening student. In fact we have been working towards a course of instruction which will more directly meet the requirements of the lower grade of instruction.

15962. But Subject XXIV. goes nearly as low as one can go?—Yes, but if you look at the syllabuses on pages 239 to 251 you will find there suggestions for methods of instruction in general experimental science. Then at page 243 you will find the memorandum I have already directed attention to. Page 245 deals with elementary agricultural science, and then with plants and soils, insect friends and enemies, measuring and weighing, and other rural subjects. We find that for courses that demand a much less broad scientific basis than Subject XXIV. does there is a great demand. For the work on the plan of Subject XXIV. there is a smaller demand. Subject XXIV. is maintained as a subject of examination in the interests of a higher grade of agricultural education than that in which the great volume of the work under the Board is done. Subject XXIV., for instance, shows the particular training we would like to see men have who are evening class pupils and who take a central class of instruction for so much of their work, and qualify themselves, say, by getting up to the combination of second stage passes or honours under Subject XXIV. before taking up work as teachers, that is as rural teachers, in agricultural subjects.

15963. Then, do I understand that Subject XXIV. is rather taken under your section 2—full time advanced instruction?—A great deal of it is, but still we keep it for those who take more advanced instruction in special classes, where that is available other than in separate institutions.

15964. Of course, there is an examination of the work that is done under these syllabuses; may I ask whether there is any pressure of any sort brought to bear upon a pupil who takes the classes that are guided by the syllabus with regard to whether he will go in for an examination or not?—No.

15965. That is purely voluntary?—Purely voluntary.

Mr. F. G.
Ogilvie, C.B.
19 Feb., 1908

Mr. F. G.
Ogilvie, C.B.

19 Feb., 1908

15966. Except for such pressure as may be brought to bear by the teacher?—Yes, who has no financial interest in the results of the examination. No one has any interest financially, and no one derives any financial advantage by the student passing.

15967. In the old days, I suppose, the teacher looked for his remuneration to the grants that were paid upon the results of these examinations?—Yes, and what was found was that the nett result of that was a tendency to attend to and do more in the direction of cramming the student for examination than of really educating them along the lines indicated by the syllabus, and the present position of the Board was taken up a number of years ago with a view to securing that the educational result should be the sole determining factor in the work of the class.

15968. These results being determined, I presume, by inspection?—By inspection, that is so.

15969. What has become of the teachers who used to conduct classes under a payment-by-results system. Are they carrying on classes now in agriculture and such like subjects?—In most subjects, yes, but as far as agriculture is concerned a good many of the teachers who made quite a good living out of it were really teachers who were not qualified to do the work satisfactorily, and those teachers have disappeared.

15970. When you say making a living out of it, I suppose they had the knack of getting men through these examinations and drawing payment for the results?—That arose in several cases, and that was a determining factor in the change made.

15971. I think you said in your evidence that the Board of Education examined anyone who presented himself?—Yes, who presented himself in the usual way.

15972. Do you mean anyone who had passed through a qualifying class?—No, not necessarily through a class at all. There is a provision for external candidates. In fact on this very subject I should say it would be not at all uncommon for a candidate to be in a place where he could not get sufficient instruction in the higher grade of Subject XXIV. He would work in a good chemical laboratory and he would do chemical work, conducting this work under the supervision of a chemical teacher. That is the type of work. He might do the same with his botany, and he might not really be a student in any class of agriculture at all, and yet he might come up as an external candidate for an examination in agriculture.

15973. But as a candidate who had got systematic instruction in a chemical laboratory?—Yes. The subject is so arranged now and the examination so conducted that unless a man had had systematic instruction he could not pass.

15974. That should apply to every subject, but as you know, the second stage is divided into two branches, the one being practical and the other being scientific. Now without receiving any instruction in any laboratory, it would be possible, I presume, for a bright youth by systematic reading to take, for example, Section A?—Tillage and crops—yes, if he had familiar personal knowledge.

15975. At any rate it is not necessary to pass through any qualifying classes of instruction in order to present oneself for an examination?—No.

15976. I think you also said that the Board of Education took no part of any kind in examinations in practical agriculture?—Did I?

15977. I took it down at the time and that is the impression conveyed, but I want to have it cleared up, and perhaps, if it is a mistake, you will correct it?—I will correct that by saying that candidates for honours in this subject have to pass the ordinary examination taken on a farm by the examiners for honours in this subject. That is, perhaps, what was in your mind.

15978. No, it was not what was in my mind. What was really in my mind was this, that the syllabus which has been issued under Subject XXIV. is divided into two sections, and it seems to me the one section is essentially practical and the other is essentially scientific—that A, B, C in fact are essentially practical and relating to tillage and crops, and to horticulture and animal husbandry; while the other three, D, E, F, are the chemistry of plants, soils, manures, crops, animals and foods, and is it not a fair division to say that one is practical and the other scientific?—Yes.

15979. And that you do conduct the examination in agriculture so far as it applies to the first three branches?—Yes, I see what you mean. In saying we did not conduct

examinations in practical agriculture, what I was thinking of was ploughing or reaping; but certainly these are practical aspects of agriculture.

15980. And the syllabus has been so arranged in fact that it would be possible for a man who has received no great amount of scientific training to present himself for your examination?—Yes, in certain sections of it.

15981. Then with regard to the remuneration of teachers who take these local classes in agriculture, rural science and the like, I presume that the teacher himself receives nothing from you, but only from the county education committee?—Yes; we pay nothing to the teacher directly, and we make it a rule that the teacher should be paid by a salary which does not depend directly on the grants that we pay, that is to say that this arrangement is not one under which the teacher will get the fees and the grants. We object to that.

15982. I suppose your grants are to a certain extent allocated according to the number of pupils that receive instruction?—Yes, they are. They depend on the number of pupils.

15983. Do you give any advantage as regards your payment to the classes that are held in thinly populated districts?—One of the objects to be gained by Section 34 as against the other Section, 32, under which these grants are payable is, that it enables us to take notice of and to give assistance in regard to the difficulties of providing instruction in thinly populated districts.

15984. You think that you do something considerable to overcome the educational distinction that exists between an industrial centre and a purely rural one?—We do something. Last winter was the first one that we had any power to do that at all. In doing so in the grants we paid in respect of last winter's work, we worked on lines which secured advantage to a certain number of pupils. This year we are doing it in an increased number of counties and what we hope is that that arrangement will gradually extend over all areas where the difficulties from sparseness of population are such as to have an appreciable effect upon the work of the area.

15985. So that this is an advantage that you give to agriculturists, if one may say so, that you do not give to those engaged in other occupations?—Yes, that is so. Of course the view is that our grants are intended to bear a fair proportion to the total expense alike in urban and rural areas. We recognise the fact that the expense of providing, say, 50 per cent. of the youth of a county with an education in the rural area is greater than the corresponding expense in the urban area.

15986. You recognise that?—We are recognising that.

15987. And you give effect to that recognition, I take it?—Yes, in the cases under Section 34. My point is that it is only within the last few years that we have had power to do so. That is all.

15988. You are at present expressing a personal opinion, possibly, and you also say it is the policy of the Board not severely to handicap youths who are necessarily removed from centres of large population, and you give them something like corresponding facilities for training themselves in agriculture?—It is not only the policy of the Board but it is the practice of the Board, and it is the advertised practice of the Board under a regulation advertised after obtaining the authority of the Treasury to do so.

15989. (By the Chairman.) What regulation is that?—That is in Section 34.

15990. (Dr. Somerville.) I daresay you know that local authorities, and of course the Board of Agriculture indirectly, are prepared to place opportunities for obtaining expert advice more fully at the disposal of the farming community than it is placed at the disposal of those following other trades and professions?—Yes.

15991. I mean to say that a farmer, whether in Scotland or in England, has the opportunity of applying to the local agricultural college or to the staff of the county, and of getting from them the best expert advice with regard to questions of cultivation and management generally that is at the disposal of those authorities?—Yes.

15992. Do you agree that agriculture should be favoured to this extent beyond other industrial occupations?—I agree that agriculture should have that facility. I am not going to say that no other occupation should have similar facilities.

15993. You do not think there is anything inherent in agriculture that should give it a preference of this kind?—

It is not singular in that respect. I could instance several other interests of that kind. But do you mean in respect of the utilisation of the natural resources of the country?

15994. I was rather wanting you to say whether that is the reason why you would do it. If so, that would be an answer to my question?—That is a political question. That is not a question for the Board of Education. It is a question for the Government. But I have always supposed that was the theory on which the special treatment of agriculture was based. I want to guard myself against saying there are not other natural productions of the country that constitute wealth that might be similarly considered. Officially, I have no opinion on the subject.

15995. We have had two reasons put before this Committee; one argument in favour of agriculture getting that advantage, both as regards education and also as regards this advice to be placed at the disposal of farmers, is that agriculture is concerned in the production of an article which is essential to the life of the people—to everyone—and the other that agriculture differs from many other industries in that the other industries produce in many cases luxuries, and therefore that there is not the same demand or need for helping them. Do you agree with those two contentions?—I do not know that I do, for, to begin with, coal is almost as necessary for the life of the people as meal. A meal is not much good without a fire to cook it.

15996. But there are other ways of getting heat besides coal?—They are not very economical. But I do not know whether cream is not a luxury, for example, looking at it from your point of view.

15997. Perhaps you know that farmers in this country generally, who have thought out the subject, are rather envious of the opportunities and facilities afforded by many other countries for education in their business, and I daresay you know we have heard a great deal of the splendid opportunities provided in Denmark, and we are constantly being reminded of what is done in Germany, and that we would all stand to gain by what is being done in the United States. Now in these countries higher technical agricultural education is controlled by boards and departments of agriculture, and not by boards of education, and are we to take it from you that these facilities of which we are all so envious would be still more attractive if they were taken out of the control of the Boards of Agriculture in these several countries and placed under their respective Boards of Education?—By no means. I am not prepared to say that at all. But what I am prepared to say is that in the conditions of public life in England the efficiency of agricultural education as a whole would be anything but promoted if it were otherwise than in the hands of the Board of Education. The conditions in other countries are peculiar to those countries. I do not think that without a very careful and elaborate analysis of each case that was used for comparison one could arrive at a fair and just conclusion on the question.

15998. I suppose, then, that you rather maintain that there are peculiar conditions, or conditions peculiar to this country, which make it desirable that the Board of Education should control all education here, whereas in other countries it is controlled not unsatisfactorily by other authorities than the Board of Education?—I have mentioned the points in which I think it is so essentially different—that the educational government of the country is distributed—with an arrangement of a central office and local bodies. This is so in England, but it does not hold good in the case of the others. In regard to the application of educational administration, the difficulties of dealing with separate sections of it would be insuperable if the technical education of each area in a section of the community were to be dealt with by a separate department.

15999. I think you have reminded the Committee with some satisfaction to yourself of the great progress that has been made in Scotland since agricultural education of the highest type has been removed from the control of the Board of Agriculture and placed along with all forms of education under the Scottish Education Department?—Satisfaction to myself only as one interested in Scotland. I have no connection with the work. The improvement has followed since I left Scotland, so that it may possibly be read in another way.

16000. When I say with satisfaction to yourself I mean you were satisfied that it is for the good of the country that the change was made?—Yes, certainly.

16001. I may remind you that time passes, and that in fact this change was made as far back as the year 1896, now 12 years ago?—Was it 1896?

16002. I was not a little surprised to find that the last year in which the Board of Agriculture administered grants to these institutions in Scotland was in the year ending 1896?—I will take that from you. I am rather glad that you have reminded me of that, because it enables me to make my case a little more plain. The Board of Agriculture work was handed over then, but the Scotch Education Department did not then administer the grants for science and art. I was at that time in Scotland, and I was one of those who felt very strongly that the educational progress of the country was seriously hampered by the fact that the Department of Science and Art, as it was at that time, having one section of the educational work under separate administration, and I was, with other people, extremely glad when the work of the Science and Art Department was transferred to the Scotch Education Department. Only, when the Scotch Education Department had the whole of the threads in its hands did Scotland really begin to progress in this matter of the application of education to the agricultural industry. That is why I rather spoke of 1900 than 1896. I had forgotten about that. I remember at that time people said—and, my lord, you will remember people saying it—that the Scotch Education Department had no interest and no sympathy whatever in the work of instruction in science and art. Those who pressed for transference said that was neither here nor there; and that the Scotch Education Department must make themselves fit to do it. It was not a question whether they had or had not knowledge or interest in science and art, but if they were to administer that section of education, they would have to have the interest in and knowledge of it. The result has followed.

16003. Which result has followed?—The improvement which was foretold from the application of science and art to the industries that pupils were to follow, and ought to be preparing to follow, has followed upon the unification of the control.

16004. Do you think that higher agricultural education in Scotland has, in fact, made great progress during the last ten years or more?—Yes, I do.

16005. I do not suppose you will be prepared to maintain that there is any agricultural college in Scotland that is better than one or two in England that might be mentioned?—No, not as agricultural colleges, but that the agricultural education takes a more real part in the general educational machinery of the country in Scotland than it does in England. That is what I am prepared to say. I do not say the individual higher colleges in Scotland are better.

16006. You think that a comparison of the progress made by the two countries during the last ten years or twelve years is in favour of Scotland, but you would not support the view that this is due, not so much to the transference of the work from the Board of Agriculture to the Scotch Education Department, as is due it in fact to the fact that the change has enabled the State to make very larger grants than was the case previously?—I have no doubt that is very much so.

16007. The grants paid to the university collegiate centre in Edinburgh in 1895-6 amounted to £550, whereas in the last year for which I have figures, which only comes down to 1905, it is £2,123?—Yes.

16008. Aberdeen has risen from £150 to £2,285, and Glasgow, including Kilmarnock, has risen from £950 to £2,957, and I believe is now well over £3,000?—Yes.

16009. You, I think, have already indicated that a great deal of the progress of unification and systematisation and general efficiency of education in agriculture in Scotland it due to the fact that it is brought into organic association with the department controlling all education, and you would say, I suppose, that in England the same progress has not been made because there have been rival authorities, to a certain extent; but may I remind you that the Board of Agriculture in England has been very seriously handicapped, and handicapped in a way that has not been the case in Scotland, by the want of funds, and that in fact institutions in England to day, which the Board of Agriculture aids, have been receiving only £1,000 for work that is in no way inferior to work that is done by a similar college in Scotland in receipt of over £3,000, and that if we had been able at the Board of Agriculture to grade up the grants in England on the same scale as in Scotland, the good work that has been done in England would have been very greatly enlarged?—Yes, that is very interesting, but there are two or three points that require to be taken into account to modify one's view with regard to it. I am not an expert in recent Scotch

snance, but I know enough to suggest several points. To begin with, I do not think the grant of £150 to Aberdeen in 1896 was really to this institution at all.

16010. No, it was quite separate?—Was that amount £150?

16011. Yes, to the university. However, I take it on the broad ground that Scotland is getting grants, somewhere in the neighbourhood of £3,000, for work that is precisely similar to that done in England on grants from the Government of only £1,000?—I do not think that is a fair statement. Scotland is not getting grants. Scotland is giving grants of £3,000 to that institution. Part of that money, no doubt, corresponds to the money which is given in England. But to enquire fully into that would require an investigation of the successive manipulations of equivalent grants as between England and Scotland. Scotland has no doubt denied herself many things in order to spend upon others, and it is an inaccurate assumption that the £3,000 comes mostly or comes only from a grant equivalent in source to the grant of £1,000 in England.

16012. Is it not the fact that these colleges are aided by the local authorities in the same way that the corresponding colleges in England are?—Yes, and the increase from local authorities since 1896 has been very great.

16013. Is it not a fact that in addition to the grant from local authorities the Treasury gives grants, and that the Treasury grant is, in the case of Scotland, something like three times what it is in England. Is that not a fair, broad general statement?—What you do not see is what has been paid into the pocket from which the Treasury makes that grant of £3,000 to Scotland.

16014. But after all, the work in these colleges is paid partly by local and partly by imperial contributions, and the imperial contributions are very much greater in the one case than in the other, and does that not account for the more efficient machinery and for the greater educative results in the one case than the other?—If you restricted your point to whether the expenditure of a large sum of money does not really account for it, I should say yes, but if it comes to a question of weighing the Scotch grant and the English grant, then it becomes necessary to see how far Scotland has diverted money from other purposes as compared with England to those purposes, recognising the importance of this subject.

16015. (By Mr. Medd.) Could you tell me, are you here representing the Board of Education or representing the South Kensington branch of it?—I am here by the instructions of the Board of Education to give the Committee information upon the work of the Board in relation to those questions of agricultural education with which we are concerned.

16016. Then we may take your opinions as being those of the Board of Education?—Where I have not stated them to be my personal opinions only.

16017. I quite understand. Where you hold it as a private opinion you have said so?—Yes.

16018. Can you tell me the principle upon which the Treasury makes grants to you?—The principle upon which the grants that we distribute are received?

16019. No. You get a lump sum from the Treasury?—No, we do not.

16020. How do you get the money?—We offer, with the authority of the Treasury, to pay grants upon certain principles which are set forth in the Regulations, and we draw upon the Treasury for precisely such sum of money as is necessary. If we are satisfied we may give £10 a head on every pupil in the first year's course of a technical institution, and therefore if there were 2,000 pupils we would have to give £20,000, and we should get that £20,000.

16021. Then the Treasury pays you after all?—It all comes from the Paymaster-General.

16022. Then your statement of account comes in with no specific grant to you for a specific amount?—No.

16023. In other words, every individual who desires to learn, I may say, weaving, to take a subject, and subjects himself to your Regulations, can obtain a grant for learning weaving?—The school in which he receives instruction obtains the grant.

16024. But you pay the school by the head, do you not?—In certain cases we do.

16025. Now with regard to the two Boards, you are definitely in favour of the transfer of the educational work of the Board of Agriculture to the Board of Education. I think?—That is my personal opinion.

16026. You have mentioned difficulties which occur in other countries where they have two distinct departments. Can you tell me of any difficulty, I mean to say of any situation which arises there which you believe to be different from the situation in England?—An essential difference in most cases that have been quoted is that the Government takes in the provision of education a share which may be described as more paternal or bureaucratic, according to how you look at it.

16027. I should have doubted that. Take the United States, quoted by you?—No, I did not quote the United States, I think.

16028. Take France. The administration of agricultural education is undertaken by a local authority, just as it is here—an authority corresponding to our county councils. It is undertaken in Holland by a provincial council corresponding very much to our local authorities, so that the specific difficulty which you raised as to the conflict between a central and a local authority does not appear to arise in these countries, does it?—It all depends upon the distribution of responsibility as between the central authority and the local authority.

16029. Then we come to the relationship between the two authorities. Here in England is that relationship, in your opinion, satisfactory?—That is a very large question. Do you mean the relationship between the Board of Education and the Board of Agriculture?

16030. Yes?—I am sorry I do not know what you mean.

16031. Do you co-operate entirely?—If you would give me a sort of illustration of what is in your mind I could answer better.

16032. Do you not to some extent duplicate each the work of the other?—I do not think so. There are three or four cases in which we both make grants to the same institution, and in those cases, which are very small in proportion to the whole, there may be a certain amount of duplication, but so far as can be ascertained, the amount of duplication is insignificant. So far as a wholesale duplication of grants goes, there is nothing of the sort.

16033. No, in one sense there is not; but you do admit that in the case of the Harris Institute and in the case of Reading you certainly do duplicate?—No, I do not think I said anything about Reading.

16034. No, it has not been mentioned; but Reading derives a grant from both Boards?—In the case of the Harris Institute, as I have explained, we have given a grant for many years and the grant we have given has been in respect of the scientific work relating to the agricultural course, just as another part of the grant was in the scientific work relating to the engineering course, and we have continued to do that because we have not yet (and the question has only arisen in the last year or so) ascertained quite how much we ought to do and how much we ought not. I have explained that that institution is a complex institution.

16035. The Harris Institute is?—The Harris Institute, with teachers and with classes common to different courses of instruction, is rather a difficult case.

16036. Then since you are unable to define or say exactly?—But I want to check you in that. We give no grant to Reading which has the slightest relation to work done in respect of which the Board of Agriculture pays a grant.

16037. No, but you would agree with me, I think, that your grant is a certain beneficial relief to the general expenditure of the whole institution. You cannot, so to say, earmark every halfpenny, but if you give a grant of £1,000 that to some extent relieves the agricultural people from having to pay?—Not if it is in respect of work which costs quite independently of the other work of the institution £1,500.

16038. Their principal told me he was unable exactly to distinguish between the two?—But we might be able to, though he was not.

16039. Yes, that is a point I would not press, but that is an institution in which to some extent you are covering the same ground?—No. There I differ. I consider that it is in no case a question of our covering the same ground as the Board of Agriculture.

16040. Then since you are unable or unwilling to define the relationship between the two Boards?—I am neither.

16041. Then what is the relation to-day between the two Boards?—I do not understand what you mean by the relation.

16042. The relationship between the two Boards is the sphere of work of the two Boards. What is their sphere of work, and how far do they join, and what are the points both meet at, and what do you consider your sphere, agriculturally?—The Board of Agriculture's position, as I understand their sphere, is that in so far as they give grants they give grants in aid of institutions of the type or grade of university colleges or otherwise for work in which the students are giving their time to an advanced course of study definitely related to agriculture—students beyond the stage of secondary school students and whole time students.

16043. Not necessarily?—You have asked me for my definition, and that is what I am giving. All other agricultural education is agricultural education, in respect of which we are bound to give such grants as we are enabled to give by Parliament. Perhaps you will allow me to supplement that answer by saying that I understand the Board of Agriculture and Fisheries make grants for the development of higher agricultural teaching such as would be appropriate in university colleges and institutions of a special character. To prevent any misunderstanding, may I say that that definition is taken from a letter written by the Secretary of the Board of Agriculture.

16044. Do you believe it would be impossible to define the respective spheres of work as definitely as they are in France and in Holland?—Nothing is impossible.

16045. Do you believe it is difficult?—Difficult and inexpedient.

16046. You would desire, of course, as you have admitted, to have the control of the whole of agricultural education?—I object to the word "admitted." I do not like the word "admitted" when it simply means stated.

16047. Stated then?—Yes.

16048. Are you of opinion that the Board, or rather the Department of Education, has throughout its existence done its agricultural instruction satisfactorily?—I consider that the Board of Education throughout its existence has taken steps proper to the circumstances of the time towards the development of the agricultural work with which it was charged.

16049. Then are you aware that one of the main reasons for the formation of the Department of Agriculture was the inefficiency of the work done by the Department of Education?—The Board of Agriculture was formed before the Board of Education.

16050. But are you aware that one of the reasons for the appointment or formation of the Department of Agriculture was the inefficiency of the work done by the Board of Education—by the Science and Art Department?—My statement a few moments ago as to the efficiency and as to the method and the manner in which the Board of Education have done their work was in answer to your question relating to the Board of Education.

16051. I said advisedly Department or Board?—I doubt very much if you did, but accepting the fact that you did, my answer refers solely to the Board of Education since its establishment as a Board of Education.

16052. Then prior to this you think that the work done by the Department of Science and Art might be unsatisfactory?—I have already stated at some length my views as to that work. I do not say that it was unsatisfactory. I say that the work did not produce the results that it was desirable to see produced. How far the absence of proper results was due to the want of satisfactory work or the want of satisfactory information at the time, I am not prepared to say.

16053. But you are aware that dissatisfaction with the work was one of the causes for the formation of the Board of Agriculture?—One of the assigned reasons, yes.

16054. In the departmental inquiry?—Very likely.

16055. Now to pass to quite a different matter. In regard to the training of teachers I suppose you do not, or I am not sure if you do, advocate any differentiation between the training of the urban and the rural teachers?—During the period of two years, which is the normal course of training for an elementary school teacher, I think that a further stage of specialisation than that which I have already indicated is not desirable.

16056. And you would probably agree that the paragraph relating to what one may call nature study in the Memorandum to the Regulations really covers all that is needed for the training of a teacher for rural purposes?—I have not given sufficient attention to it to be able to give a direct answer to that question—not to that particular section of the work, that is.

16057. Then with regard to the elementary school, it has been mentioned in reference to the Board of Agriculture, and have you ever heard any suggestion that that Board of Agriculture should become responsible for any elementary school?—No.

16058. Of course, in your work at the Board I take it for granted that you use every effort to supply every need; and is there a single rural higher elementary school?—You made a large assumption in saying that we made every effort to supply every need.

16059. I took it for granted?—That is too much. We make every effort we can, but that is a very important limitation. The higher elementary school for rural education and its possibilities in rural areas have not been appreciated for a sufficient time yet to admit of the establishment of such schools on a considerable scale. Personally I hope to see a very considerable number of them presently, but that takes time.

16060. Now in regard to the elementary school again would you suggest any attempt to teach anything of a definite agricultural character?—It is so difficult to understand what you mean by the question. If you will tell me the sort of thing you have in your mind, I will answer you.

16061. Then I would say what is your opinion in regard to an attempt to teach technical instruction in agriculture?—Still I am a little in the dark. Do you mean ploughing?

16062. Technical plus the business of farming, and so on?—I have already gone into that pretty fully, and I do not think I can add anything illuminating on it.

16063. I was not clear from your answer whether you believed in the possibility of giving a rural bias or the desirability of giving a rural bias to the elementary school. —I do not think it is worth while trying to teach a boy of eleven to comb a horse in an elementary school, but I do think it is worth while teaching a boy of eleven to distinguish a horse from an ass, and to recognise the relation between the different types of animal that are found in his neighbourhood, and that it is possible and beneficial to teach him something about plants and to teach him something of their modes of growth, and to give the instruction upon modes of growth, with definite relation to the plants that are likely to be of importance in farm work.

16064. But do you mean to teach all those subjects from the educational and not the technical standpoint?—Yes, exactly.

16065. You do not, I take it, desire to give a rural or an urban bias to any school?—I desire to see a rural bias in every rural school, and an urban bias in every urban school.

16066. You would?—Yes.

16067. I disagree with you entirely.—I am sorry that my powers of explanation have been so deficient as not to have made that plain hitherto.

16068. You do not believe in treating subjects on the principle of equilibrium and without any bias, having regard to the infinite variety of pursuits which the children must inevitably follow. You prefer trying to influence them in a specific direction by bias?—No, that is speaking from a wrong point of view. I have been endeavouring to expound my position for several hours, and I may say that my point of view is that I would give a rural bias in rural schools, because I could secure a better education through matter with which the pupils are presumably familiar from every day contact, and not necessarily because the great majority of them are going to be employed in connection with these matters, but certainly with some knowledge that the great majority are so to be employed; and because of that certainty I should make teachers more able to use as fully as possible objects of rural interest in developing the intelligence of, and generally educating, the pupils.

16069. Would you be surprised to hear that a better agricultural labourer could be procured from Bellenden School here in London than from any village school?—I should.

16070. Then in regard to secondary schools, do you advocate any specific rural bias in the secondary schools?—I have already gone into that very fully.

16071. No, I think not. I think you said, if I may say so, that subjects bearing upon rural life might with advantage be taught. That we all accept. The question is whether the schools should have a rural bias, or whether they should preserve a strict equilibrium, as I have said?—I have explained that the precise course in the secondary

Mr. F. G.
Ogilvie, C.B.

19 Feb. 1908

Mr. F. G.
Ogilvie, C.B.
—
19 Feb., 1908
—

school should depend on the circumstances of the school. If it is a small school in a limited area entirely rural the probability is that the school would only, as a secondary school, run a three years' course, and the majority of the pupils remaining in it being eventually intended to pass from the school to rural occupations, the work of the final years at the school should have that in view; but as it is a secondary school, and intended to give them a wide outlook, it should not be restricted in any sense by a definitely economical view of agricultural interest.

16072. Have you had any experience of agricultural sides attached to secondary schools?—Personally?

16073. Yes.—No; but I have had experience personally of pupils in a secondary school with a side common to all who are going to follow technical pursuits, and in which a considerable proportion were destined to work in agriculture, and subsequently did excellent work in agriculture.

16074. You do not think their general education suffered?—I think their general education benefited.

16075. Then assuming that your Board took over the whole of this agricultural education, do you think you would be prepared to do for it what the Department in Ireland can do?—No.

16076. You do not think that?—No, because the Department of Agriculture and Technical Instruction in Ireland is a department not merely for agricultural education but for the developing of the agricultural industry in Ireland, which is a very much wider view of the thing, and a much wider view of its responsibilities than the Board of Agriculture in England has in that respect.

16077. Then you consider so far that you are at present doing all the educational work with the exception of the higher agricultural college work?—I consider that we have a programme of encouragement and aid which is capable of development in such a way as to cover the great bulk of the field in the direction of agricultural education. I should be very unwilling to say that that programme is complete, or is entirely satisfactory, or will not require modification almost annually in the light of experience.

16078. But you do not recognise any educational work as done by other Departments of the State? I mean of the advanced agricultural colleges of which we spoke?—I recognise that they are valuable.

16079. Do you recognise any educational work done by other Departments of the State?—I recognise its value.

16080. Do you recognise that any other Department of the State does educational work?—Yes, certainly. The Agricultural Colleges.

16081. I meant the existing advanced agricultural colleges.—You put a very general question. The Home Office educates, or gives grants to certain classes of education. That is educational work. The Army maintains Army schoolmasters.

16082. But my point is this, that the attitude which I think you take up is that all education should properly be under one Department of the State, and I merely wish to point out to you that other Departments of the State are already doing very valuable work?—Yes, I was talking in a very general way. I certainly never referred to gaol schoolmasters nor Army schools.

16083. There are the Home Office schools and Navy schools under the Admiralty. You have taken no account whatever of that?—But those schools are all schools, say, within the Admiralty and the War Office—they are within cantonments. They are under the Navy Department, and there are similar circumstances in each case almost.

16084. But that shows that other Departments of the State can do efficient educational work?—I never questioned that.

16085. In regard to the Board of Agriculture, no mention to-day has been made of their leaflets, which have had the most valuable educational effect with the lower class of farmer?—Most valuable.

16086. I mean that ought to be recognised in speaking as to its work, or the transfer of its work?—I was not speaking as to its work. I have not attempted to assess the value of the work of the Board of Agriculture in education in any sense, otherwise I should have had to say a great deal more than I have done.

16087. (By Professor Middleton.) With reference to the examination you have just had from Mr. Medd, there is one question I ought to ask you. I recognise it is your personal opinion that the work of agricultural education would be more conveniently dealt with from the adminis-

trative point of view if all were done under the Board of Education; but assuming that the system at present in vogue were continued, do you see any serious difficulty in the two Boards working in harmony in future as they have done in the past?—I see no difficulty at all. But may I point out one thing in the way of serious business, that is, that the real distinction is that in educational work, that is the educational work of these institutions, the grant of the Board of Education is an automatic grant, and depends on the work done, and so on. The Board of Education could not conveniently assess, and it would be outside its function to assess, the value of the experimental work and of the consultation work, and that sort of thing, of an institution as a centre of agricultural research, or the application of research with a view to the interests of an industry in regard to any particular locality. That I regard as pertaining essentially to the Board of Agriculture. The only section of their work, I think, that should as a matter of national organisation be more properly classed in the Board of Education is their purely educational work.

16088. I recognise the difference you have pointed out between the systems of this country, of England especially, and foreign countries, but in looking at the system of agricultural education just now adopted both in Prussia and in the United States, I find that there no practical difficulty seems to occur in administration through the fact that the work is divided to some extent between their Departments of State corresponding to our Boards of Education and Agriculture. It seems to me that if it is possible to develop, as have been developed, very perfect systems in the countries which I have named, under the dual control of Education and Agriculture, it ought also to be possible to develop a suitable system in England, in spite of the fact to which you drew attention of the special local conditions in this country. I cannot see any difficulty?—I must say that I have a very strong feeling that the fewer Government Departments the local authority has to deal with upon a particular subject the better. The administration is much simpler if they have to deal with one for all their educational work, and another for all other work of a particular character. There are constant misunderstandings locally where you have got more than one authority.

16089. I agree that there is something in that point of view, but on the other hand there is, I think, a great deal to be said on the other side. You state it as your opinion that it would be a great mistake to separate educational committees in the counties into two distinct committees, one dealing with agricultural education, and the other dealing with general education?—Yes.

16090. But would you consider it desirable that education committees should appoint special sub-committees to deal with the question of agricultural education?—No.

16091. You would not?—No, I think that would be no good.

16092. Is not that the common practice?—It is the common practice.

16093. In fact, all the practical work of the Education Committee is done. I think you will agree with me, by sub-committees?—Yes.

16094. Would it not be possible, therefore, just as you divide up education under local authorities among sub-committees, to separate their work in such a way that the work done by certain sub-committees should be under the inspection of the Board of Education while that done by the agricultural sub-committee was more directly controlled by the Board of Agriculture?—Yes, the work done by the Board of Agriculture Education Committee would be nothing. It is the work done by the Education Committee under the advice of the Agriculture sub-committee, and that makes all the difference, because you get the united control, which you do not get if you separate the two.

16095. I quite see that point. Of course the unity of control comes nominally from the Education Committee; but the Education Committee always acts according to the advice of its sub-committee, or almost always so?—Upon agricultural questions.

16096. And also upon other educational questions which it delegates to the sub-committee?—Yes.

16097. So that it does not seem to me the administrative difficulty is a very serious one?—The work done under the advice of the Agricultural Committee is not segregated. Much of that work is and ought to be entirely worked up and worked in with other work done under the direction of the same Education Committee, and you cannot separate it, for it may be done by the same man. He may do in the same room work in the interest of the agricultural

sub-committee and work in the general interest. That is my difficulty.

16098. It seems to me very important indeed, since so much power has been given to the local authority in England by the State, since almost all control has been given to it in the matter of rural education, that the local authority should have at its disposal the very best technical advice which the State is able to give, and it seems to me that for that reason, when we come to deal with questions which are purely agricultural, it would be better if the local Education Committee were in direct touch with the Board of Agriculture rather than in direct touch with the Board of Education?—Of course you rather evade the question by ignoring the distinction between agriculture and agricultural education. The point is that for the great volume of the work the local committees have to supervise it is work in preparation for the practical work of agriculture—as distinct from the higher scientific aspect of agriculture which is work upon which expert opinion can be obtained readily. So far as it is expert matter the method of communicating instruction is educational matter. Neglecting this distinction you might just as well say in the teaching of physics all the teaching of physics in the secondary schools ought to be done under the direct authority of the Royal Society, we will say; whereas it is really not physics but the teaching of physics, that is the difficulty in that particular matter.

16099. Of course the real problem, as I think you have said in discussing the question already, is the problem of the teacher?—Yes.

16100. And the finding of the teacher?—Yes.

16101. It has always seemed to me it must be of very great importance for the teacher as a teacher to be in direct relation with that Department of the State which deals with his own particular subject, rather than with a Department which does not deal with his subject, but with instruction?—Teachers in the higher grade of the work certainly have a definite advantage to look to in that relation. The teachers who are at the distal end of the organisation really have to derive their inspiration from intermediate guides; and I do not think that as far as the teacher's knowledge of his subject is concerned it is of very much importance which central State Department he works under.

16102. Could you explain footnote on page 13 of your Board's publication "Regulations for Technical Schools": "The payment of grants, under this chapter, to institutions which form parts of Universities or University colleges may be subject to reconsideration in view of the allocation of the Treasury grant to University colleges." Are there Departments other than agricultural in these colleges which have been receiving grants from the Board of Education?—Yes. Take Leeds, for instance.

16103. The Harris Institute then is not a single case?—The Harris Institute is not a University college.

16104. But it is not a single case of a complex problem?—No. We have given as yet no grant to any Agricultural Department in a University College in receipt of aid from the Treasury University College's Grant. But in Leeds University we have given aid to, say, the Weaving Department. That is the sort of thing.

16105. Does this mean that you now intend to withdraw your grant from the Weaving Department at Leeds because of the Treasury grant to the University?—No, it means that when the Treasury grants to these colleges have been revised, then it will be for the Treasury and the Board of Education to deal with the grants under this chapter without any question of vested interests.

16106. Just as it might be possible in giving a grant in connection with the Board of Agriculture to deal with the question?—Yes, that is so.

16107. Then you referred to the revision of the syllabus in the Principles of Agriculture, by a special committee of the Board?—A special committee of our Board. Shall I give you the names?

16108. I have an indistinct recollection of doing something on that syllabus. Was it compiled by the Agricultural Education Association?—No. Every now and again we revise the science examination syllabuses, and we get our advice, in revising them, from people who know something about the special requirements of the case. Take last year; we had the Building Construction syllabus under consideration and we got together two builders, two teachers of building construction, a professor who had dealt with engineering subjects, and two officers of the Board who had been interested in the particular subject, and they revised the work.

16109. That is the syllabus which was originally prepared by the Agricultural Education Association, and has since

been revised by your Board?—One of the Assistant Secretaries of our Board, with the assistance of Mr. Warrington, and I think in consultation with Professor Somerville, was on the Committee, with Professor Miall and Mr. Hall. That was the Committee. It was before I came in. I mean we took steps, as the usual practice is, to get on the committee the best men we could to advise us about these syllabuses.

16110. (By the Chairman.) This Report on the Universities and University Colleges is in answer to a circular which is sent to them to fill in?—Yes.

16111. But none of these colleges are inspected by the Board of Education?—No. The circular is sent out and the replies to the circular form the subject of correspondence between the Board and the colleges until we get the material in a sufficiently clear form for publication in the Report.

16112. But you do not inspect these colleges?—No, the colleges are inspected at the instance of the Consultative Committee of the Treasury every five years.

16113. Therefore your relation with these colleges is simply for the purpose of collecting this information?—That is so.

16114. Now I want rather to ask you how practical effect could be given to your view that the various local educational authorities should be unified—because that is really what you think—that it would be better if they were encouraged and guided by one central department instead of by two departments?—Yes.

16115. I understand your point of view, but how is that possible? Lord Barnard has already alluded to it but I want again to emphasise it. This Act of 1889, constituting the Board of Agriculture, is very explicit. It states that the Board of Agriculture "may also undertake the inspection of, and reporting on, any schools which are not public elementary schools." Therefore the secondary schools are not out of their purview, and in regard to schools in which technical instruction, practical or scientific, is given in any matter connected with agriculture or forestry or which admit that inspection the Board is qualified. These powers you will admit are very wide, and there is certainly no legal objection to the Board of Agriculture undertaking operations distinctly allowed by the Act of Parliament?—No there is none.

16116. I think you will admit that?—Yes, I will.

16117. Now that points to the great need there is of some understanding between the two departments. It is quite obvious that under this Act and considering the powers which you have and under which you issue your regulations there is not only as we have pointed out, a danger of overlapping but there is a danger of positive friction. Let me for instance submit to you this point. You will admit that the Board of Agriculture would be perfectly justified in issuing any day a report like this one of Mr. Dymond's by one of their experts or inspectors, containing suggestions on rural education with specimen courses of nature study, gardening and rural economy. Now what would be the position of a County Council receiving this document from the Board of Education, although I understand it does not represent the definite views of the Board of Education, and is not an official document of the Board of Education, but Mr. Dymond has been allowed to publish it?—No, it is an official document of the Board of Education.

16118. You consider it does represent the views of the Board of Education, because I want to know that exactly?—The relation of the views of the Board were stated in the preface. It says this on page 2: "While inviting serious attention to Mr. Dymond's memorandum, the Board must not be thought necessarily to endorse every suggestion it contains."

16119. There is nothing to prevent the Board of Agriculture publishing a similar document, saying "While inviting serious attention to Mr. N's memorandum they must not be thought necessarily to endorse it." Therefore it is quite clear that the County Council receiving the advice from two quarters would be placed in rather a curious position, and there is nothing at this moment to prevent this. Is it not, therefore, desirable that before further extension is given to the number of your officials and to the expansion of your control in the agricultural sphere, that you should come to some understanding with the Board of Agriculture, as we all look forward to a great expansion of agricultural education. We look forward to the increase of the winter schools; we look forward to the increase of the dairy schools; and we look forward to the expansion of schools such as Basing. Therefore

Mr. F. G. Ogilvie, C.B.

19 Feb., 1908

Mr. F. G.
Ogilvie, C.B.

19 Feb..1908

you will admit that there will also be required an increase of the personnel?—Certainly.

16120. Either under the one or under the other department?—Certainly.

16121. And therefore it will be absolutely necessary to determine under whose guidance (I use your own words, I think) county councils are in future to work—who is to give them the advice?—I agree generally as to that, but I want to remind you that while it is the case that there are no legal difficulties, as far as the Act of Parliament is concerned, in the Board of Agriculture doing just what you have said, that is considerably qualified for practical purposes by the fact that Parliament has assigned to the Board of Education the authority and the power and the duty of aiding by grants much of the instruction which is described under the section of the Act of 1889 which you read, and that as a matter of fact the question of the delimitation of duty between the two Departments has in the past formed matter of just such consultation as you suggest, and in a passage from a letter of Sir Thomas Elliott's, which I read lately, the matter is set out. This is the letter in which the result of the communication really was specified. This is a letter dated the 10th of January, 1905, from Sir Thomas H. Elliott, to the Secretary of the Board of Education, South Kensington, saying: "I am directed by the Board of Agriculture and Fisheries to state for the information of the Board of Education that the Board think that the understanding arrived at by Sir William Abney and myself in 1903, should still govern the distribution of grants to agricultural colleges and schools, and that the Board of Agriculture and Fisheries should make grants for the development of higher agricultural teaching such as would be provided in university colleges and institutions of a special character, leaving to the Board of Education the duty of subsidising agricultural schools, where the instruction was generally of a secondary school character, and evening schools with classes in agricultural science and rural economy. The Board do not think that any practical difficulty is likely to occur in connection with this arrangement. They publish annually a detailed Report," and so on. So that you see we have arrived at a working rule which is quite sufficient pending the arrangement in reference to the suggestion as to the Board of Education Act, of 1889, that a transference of powers of education from the Board of Agriculture should take place. So long as that does not take place we have this working agreement and that is what we have been going on with all these years.

16122. Now I want further to ask you whether you are not prepared to admit that there is some force in the argument that there is an advantage in retaining certain powers in the Department which has for one of its objects, as the Act of 1889 says, with reference to the Board of Agriculture, the making or aiding in making inquiries, experiment and research, and collecting of such information as they may think important for the purpose of promoting agriculture? The Board of Agriculture is to a certain extent in the position of promoting the industry, and the Irish evidence shows that the connection between the promoting of the industry and the promoting of agricultural education is so close that we experienced considerable difficulty in getting from the Irish Department the figures of what was devoted to promotion of the industry and what was devoted to promotion of the education. That seems to me to be a very important point; that the Department in the State which is closely connected with the people who represent the industry, and is therefore always in touch with and knows their needs, should have the control of the institutions for their education. That applies, as I need not tell you, more and much more to these practical schools, to what you would call schools giving the lower forms of education even, than to the higher, those of a university type—that applies to winter schools, to dairy classes, and even to such things as thatching and hedge cutting, and so on. I merely ask you to consider the importance of the Irish experience, and I think I may add also the experience of other countries which have an Agricultural Department. It is the special nature of the industry, the special nature of the instruction to be given, which makes it so desirable that one department should be in touch with the representatives of the industry, and also in touch with their education?—I quite recognise that.

16123. I hope you admit the force of that?—Yes.

16124. Because, as you see I have admitted to you that it is of great importance that the county councils should have guidance not from two sources, and that there should not be a dual control?—Yes.

16125. But that leads me to express the hope that the two departments will go over that ground again. The

letter you gave was written in 1905, showing, therefore, how the necessity was felt of drawing together. But the question is whether as the result of this Committee you will not be prepared to go into it again?—I ought to say that I quite recognise the advantage of making the connection between the work of inquiry and of experiment and research, and so on, for the promotion of the industry, on the one hand, and of the education of those who are engaged in the industry, on the other, as close as possible. That is an advantage in the direction you indicate but the point is that the advantages in the other directions are in my opinion greater, and that this connection between the education and the promotion of the industry, by inquiry and otherwise, is a relation which is comparatively easy to maintain, although the two are under separate Departments. It is a relation which does not cause any separation of duties in the local administration of the industrial work, because that is separate from the local administration of education, and the two things can be worked into one another, and the needs, too so to speak, quite well, although the education is under a separate head.

16126. I understand that Sir Thomas Elliott's letter was written with the object of making it clear that all agricultural education, other than in elementary and secondary schools, should be under the Board of Agriculture?—Quite the contrary.

16127. That is not so?—No. Shall I read the letter?

16128. Yes.—The letter is as plain as it can possibly be. It says: "that the Board of Agriculture and Fisheries should make grants for the development of higher agricultural teaching such as would be provided in university colleges and institutions of a special character, leaving to the Board of Education the duty of subsidising agricultural schools, where the instruction was generally of a secondary school character, and evening schools with classes in agricultural science and rural economy." That is the definition.

16129. (By Mr. Medd.) If I may say so, that rather confirms what Lord Reay has just said. Sir Thomas Elliott differentiates between colleges or institutions of collegiate grade, and then he goes on to say "and others." He gives two kinds at the beginning, the higher and the lower?—That is how you read it.

16130. (By Lord Barnard.) May I point out that this memorandum of Mr. Dymond's does deal distinctly with the agricultural colleges of University standing?—Yes, but that is the specimen course.

16131. (By Mr. Medd.) Sir Thomas Elliott in that letter distinctly refers to schools of different grades which are to be recognised as under the Board of Agriculture. Then he goes on to say that schools of a secondary character, that is, secondary schools, are under the Board of Education?—I am afraid I cannot read that into it. May I read the words again?

16132. Yes.—It says: "that the Board of Agriculture and Fisheries should make grants for the development of higher agricultural teaching such as would be provided in university colleges and institutions of a special character." That is higher agricultural teaching, such as would be provided in university colleges and institutions of a special character. Now the next case is indicated in these words "leaving to the Board of Education the duty of subsidising agricultural schools, where the instruction was generally of a secondary school character, and evening schools with classes in agricultural science and rural economy."

16133. (By the Chairman.) You do not disagree with this, that although there is this letter, there are constantly questions coming up which make it desirable that there should be, as between the Board of Agriculture and the Board of Education, an understanding from time to time as to what is within the purview of the one and of the other?—If it is necessary to revise the existing understanding there is no doubt at all the Board of Education will be delighted to discuss the matter with the Board of Agriculture and to revise things in whatever direction they find to be most desirable. I should point out, however, that the correspondence to which I have just referred followed on an interview I had with Sir Thomas Elliott in January, 1905, and that the understanding then arranged was clear and simple. It was in direct continuation of the arrangement made a couple of years before through my predecessor. It has formed the basis of our action in dealing with all schools related to agriculture; and, as I have already explained, it is perfectly satisfactory as a working arrangement, cases which present difficulty in its application being extremely rare.

Mr. H. S. LAWRENCE, called and examined.

16134. (*By the Chairman.*) You are Director of Agriculture in Bombay?—Yes.

16135. Perhaps you would give the Committee some information about the organisation and the Budget expenditure of the Department of Agriculture in India?—It is only within recent years that the Department has been established on any large footing, but within the last two years the Secretary of State has sanctioned an expenditure amounting to £160,000 a year, of which £16,000 is spent by the Imperial Department directly on a Research Institution at Pusa, in Bengal, and the balance is distributed between the several provinces of India. The grants vary from about £17,000 to some of the smaller provinces to £23,000 to the larger. I suppose you would prefer I should speak in pounds rather than in rupees?

16136. Certainly.—Then in addition to this Imperial Budget expenditure, each province spends a certain amount from provincial revenue. How much that is in each case I cannot say, but in Bombay we have been spending about £12,000 extra.

16137. How much do you get from the Imperial grant?—£23,000.

16138. Therefore you have about £35,000?—Yes. £23,000 from the Imperial revenue and £12,000 from the provincial revenue. That is not a settled grant in perpetuity, because at present we are spending large sums on purchasing farms and a site for the college at Poona, and the buildings of a very large institution that we are putting up there. What the annual expenditure will be I do not know, but I should not think it will fall below £30,000 to £35,000 for the Bombay provinces alone.

16139. Your college is at Poona?—Yes.

16140. How many European teachers have you at the Poona College?—Three.

16141. In what branches?—There is a professor of chemistry, who is also the principal, a professor of botany, and a professor of agriculture.

16142. And attached to the college there is a farm, is there?—Yes.

16143. Do the students work on the farm?—Yes.

16144. The number of the students is on the increase, is it?—Very largely. Agriculture was included as a branch of the College of Science previously which used to be looked after by one European officer, who also had to supervise all the agriculture and agricultural conditions of the whole Presidency. So that the amount of time he could give to instruction was very little. The system was not very popular, for various reasons, and we only had about five students in the college five years ago. Now there are about 30 to 40 who enter every year, and as there is a three years' course we have at present 95 students.

16145. Amongst those students are there any sons of practical farmers, or rayats?—Yes, there are a considerable number.

16146. Their object is to return to cultivating the soil, is it? They are cultivators?—I think they would prefer to have Government employment, but I have known one or two cases where big landholders have proposed to put their estates under the care of these men.

16147. That will be, of course, a gradual and slow development?—Yes.

16148. We have heard that some zemindars prefer to have the advantage of trained natives to look after them properly?—Yes, in these cases they were money lenders who lately acquired the estates, and, knowing nothing about agriculture themselves, they preferred to employ these men.

16149. Then as to the kinds of employment that they get under the Government, will you describe that?—There are two departments. There is the Revenue Department and there is the Agricultural Department. In the Agricultural Department they would begin at a salary of £2 a month, which is considered adequate, and they would be put in charge of the farm—not immediately, of course, but they would be trained to be in charge of our farms. We have 13 farms.

16150. Thirteen farms which are owned by the Government?—Yes.

16151. In various parts of the Presidency, that is?—Yes.

16152. And of different types of agriculture?—Yes.

16153. (*By Mr. Lamont.*) All in the one Presidency?—Yes. I am speaking of the Bombay Presidency only.

16154. (*By the Chairman.*) At the head of the farm there is a native assistant?—Yes.

16155. What is he called?—A farm superintendent.

16156. But he is a native?—Yes, and his salary would be from £60 to £100 a year.

16157. Then you have got the circles?—Yes.

16158. The Presidency is divided into two circles, is it not?—Yes.

16159. At the head of a circle there is a deputy director?—Yes.

16160. What are his duties?—He has to look after the farms. Our divisions are one of the Province of Scinde, and the other the Proper Presidency, and, as you know, they are very distinct. They would look after the farms in the two distinct divisions, and they would have to examine the conditions of agriculture generally, and would be called upon to report upon such questions as the advisability of the construction of canals through a certain area, and of the tracts which it would be advisable to take the canals through.

16161. Do the natives come to these farms to see what is going on there?—Most of these farms have only been started within the last three years, so that they have not yet become widely known, or gained very general confidence.

16162. But that is the object?—That is the object.

*16163. The farm is an object lesson?—Yes, certainly, and in some cases the natives do come, and they have obtained real benefit from seeing the operations on the farms.

*16164. Of course, these demonstrations which you carry on must be very carefully carried out, so that, as regards the small holder, you must take into account what his means are, and what the means of the small cultivator are to carry them out, because we know they are mostly small cultivators?—Yes, certainly.

*16165. Experiments are also carried out on the farms, I suppose?—Yes.

Mr. H. S. Lawrence.

19 Feb., 1908

*The following notes, supplemental to the above answers, were received from Mr. P. J. Mead, Acting Director of Agriculture and Co-operative Credit Societies, Bombay, successor to Mr. H. S. Lawrence:—

16163-5. The main object at these stations or farms is to conduct experiments, and the bulk of the present expenditure is devoted to experimental work and scientific research. The present accepted view is that experiments should be carried out at the Government stations and demonstrations mainly on private lands; but except in the new irrigational tracts there is not at present much that can be usefully demonstrated to the rayat.

Mr. H. S.
Lawrence.

19 Feb., 1908

16166. Of course, co-operation is yet, I suppose, quite in its infancy?—Do you mean the co-operative society?

16167. Yes.—It has not made a very large start in the Bombay Presidency, but I think Mr. Moreland will tell you they are doing very well in his province.

*16168. Then with regard to agricultural banks, what is the present development of that subject? Is it making much progress, or has it made any progress?—I am afraid I am not able to answer that question. It has been outside the line of my work. Now the agricultural banks are placed under the supervision of the director of agriculture.

16169. They are now?—They are now.

16170. Is there a Provincial Act?—No, there is a universal Act for all India.

16171. Was that passed under Lord Curzon?—Yes.

*16172. Will the agricultural banks be more or less Government Banks, like the Postal Savings Banks?—This is a subject I am not sufficiently acquainted with. Mr. Moreland knows about it. They were not under my supervision when I was there, but they are under the director now.

16173. Then, of course, your department deals with everything connected with insects and plants, and the various things which are damaging to agriculture?—Yes.

16174. I suppose at Poona there is a good laboratory?—Yes, a chemical laboratory. They have got a temporary one, but they are building a very good one.

16175. And bacteriology would come in?—That will come in the future. At present we have not got a bacteriologist.

16176. But that will come?—I hope so.

• 16177. As showing the importance which the Government attach to agricultural education, every officer of the Indian Civil Service is now required to study the elementary problems of Indian agriculture during a short stay at Poona?—Yes.

16178. Every civilian?—Yes.

16179. Can he take that at any time of his career?—No, he is required to do it within the first year.

16180. How long does he stay?—Six weeks. For six weeks he is at Poona, but only three weeks of that are specially devoted to agriculture.

16181. What is done in the other three weeks?—Survey operations.

16182. That is to give him some knowledge of the subject?—It is very short. It gives him an elementary knowledge of what is being done.

16183. Then the officers who are appointed as directors of agriculture are encouraged to come to England in order to attend some of the courses at the higher agricultural colleges here, are they not?—The present director in Bombay has just been here. I do not know of any other director now in India who has.

16184. The present director, the one who has just been appointed, was encouraged to make use of his leave for that purpose?—Yes, he was given special terms.

16185. Where did he go to?—Bangor.

16186. Then you wish that more information were available in English agricultural colleges regarding tropical agriculture?—Yes.

16187. You think that in the Universities of Cambridge and Edinburgh readerships should be established in tropical agriculture?—Yes. A suggestion to that effect has been made by an Indian officer who is at present home, looking into the matter of agricultural education.

16188. At present is tropical agriculture not taught anywhere?—I understand it is not.

16189. Then it would be desirable to obtain someone who had been trained in India, who had Indian experience?—I should think it would.

16190. Now those who have the diploma are eligible for the revenue service?—Yes.

16191. That was brought about in recent years, was it?—Yes.

16192. How long ago was that?—Four years ago about.

16193. That applies to natives?—Yes.

16194. And also to the provincial service?—From those posts they would rise up into provincial posts of deputy magistrates and collectors.

16195. They can rise from the inferior to the other services by further examination?—Yes, and by good work.

16196. Then the Government are fully alive at the present moment to the importance both of improving the teaching of agriculture and of finding employment for those who, at those institutions, have obtained a diploma?—Yes, they are.

16197. The Forestry Department is a special department, and I shall not ask any questions about that?—That is so.

16198. (By Lord Barnard.) Did you state that the supply of teachers is principally from this country?—The superior teachers are three, but for the 90 students there are about five assistant teachers, who are all natives of India.

16199. Are they trained in this country or in India?—In most parts of India such men have been trained in India; but in Bombay we have sent home three men to be trained at Cambridge with a view to filling such appointments.

16200. In fact, you do consider that such institutions as Cambridge are almost essential to provide, at any rate at the present time, a supply of teachers for such institutions as yours?—Yes, certainly. If it had not been for the supply we got from Cambridge and Edinburgh we should not have been able to start our Agricultural Department as we have done.

16201. Have you anything to do with the engaging and the appointment of those teachers?—No. Do you mean the English teachers?

16202. Yes.—I discovered, and was instrumental in securing one man.

16203. I wanted to know what your experience was; whether you found an adequate supply of teachers, or whether there was a difficulty in getting them?—That I cannot say. They are appointed by the India Office here. Sir Thomas Holderness selects them.

16204. (By Mr. Lamont.) Is there a Minister of Agriculture for the whole of India, as well as a Director of Agriculture for each Province?—The man who corresponds to the Minister of Agriculture would be a member of the Viceroy's Council. Then there is an Inspector-General for all India. He is a purely advisory officer, who informs the headquarters in the Secretariat at Simla. He is sent to inquire into special problems in the different parts of India, and he gives the results of his inquiries.

16205. Would it be any part of his duty to co-ordinate the work?—Yes; but he has no control over the several provincial departments.

16206. Lord Barnard asked you about the training of native teachers; is there any special institution for the training of native agricultural teachers?—It is intended that those shall be trained at the Research Institute at Pusa; but the working of that institution has not yet been perfected, and our best men in Bombay have really done their training at our farms under Mr. Mollison, the present Inspector-General of Agriculture.

16207. You said that on the 13 farms there are experiments conducted?—Yes.

*The following supplemental notes were also received from Mr. P. J. Mead:—

16168. The co-operative movement has made a good start on sound lines in Bombay, though not so advanced as in the United Provinces. In certain districts successful banks have already induced imitators, and with more capital the movement is certain to spread. Some capital has been made available through a Central Bank in Bombay of which the Hon. Mr. Vithaldas Thackersey is the moving spirit, but many competent observers hold that at this stage more capital is the chief want, so as to enable new banks to show that they can successfully administer moderately large sums. Questions of Agricultural Banks proper, for the purposes of financing (1) special crops, such as sugar cane, and (2) co-operative societies, and offers of assistance from such bodies as the Salvation Army, are among the questions at present under consideration.

16172. Development of these banks may be expected, as stated by Mr. Moreland, on Raiffeisen lines, and Government control must be closely limited to the necessities of the case, such as the giving of advice and auditing accounts.

Government registration, with its few attendant privileges, follows on approval of the bye-laws submitted by any new society desiring registration.

Mr. H. S.
Lawrence.

19 Feb., 1908

16208. Is that experiment in the sense of demonstration or research work, or both?—The experiments are such as to ascertain whether better varieties of a special crop can be grown, such as better varieties of cotton or wheat. The demonstration would be when you have discovered what special variety that was. When you grow them the rayats come and see if it is a success.

16209. So that both those branches of work are carried on in India?—Yes.

16210. Is there any organised system of travelling inspectors and advisers radiating from those centres and going out amongst the rayats?—We have only got two men we have been able to send out so far, because we do not like to send them out unless they are thoroughly experienced men. But we intend to develop that as our staff gets more numerous and better experienced; but it is a dangerous thing.

16211. Then is there any encouragement of school shows or school gardens in the elementary schools in India?—I believe some such systems exist in the Central Provinces, but I have not seen them.

16212. In the last few years in the West Indies we have had very great development both of school gardens and school shows, and in the colony with which I am connected, in Trinidad that is, there is a population of 100,000 Indians, and they show themselves very ready to respond in this work. Many of the elementary school teachers are Indians, and have taken up the work very keenly indeed, and I was wondering whether you had any similar experience in India?—A similar experiment was tried about 20 years ago, but without success, and we are rather nervous about starting that again.

16213. I suppose these experimental farms are open to the elementary school teachers who are desirous of going there for a short course, say for a month's course in agricultural training?—We have training colleges for those elementary school teachers. There are four in number for the different divisions and provinces of Bombay, where we have numerous languages. At those four training colleges there is a small farm attached, a matter of 10 acres or so, and there the elementary teachers are shown something about agriculture. That is chiefly with a view to incorporating the result of their observation in nature lessons. In India there is a very wide distinction between the professional classes and the cultivating classes, and the teachers are drawn from the professional classes, and as a rule they know nothing whatsoever about plants. So that we are not prepared, as a general rule, to ask them to start and cultivate gardens or small farms, because we know they would not make a success of them.

16214. Is there any development of agricultural classes of an intermediate grade? Is that any part of the future scheme of agricultural work in India, between the elementary school and an institution such as that at Poona?—Not at present.

16215. I very strongly agree with what you said in regard to the establishment of a readership in tropical agriculture in one or more of the British universities, for which there is a great need also in connection with the West Indies, and I should like to know whether you have thought out the possible lines on which it might be created, or whether the Government of India itself has any idea of subsidising such a readership in any agricultural university here?—I do not know that any such proposal has been put before the Government of India, and I have no authority to speak on their behalf. I can only express my personal opinion that that would be a very valuable thing.

16216. Can you tell me whether that is an opinion that is at all widely held by others?—The suggestion was put before me by Mr. Barber, who is an Indian botanist at present visiting several agricultural institutions at home, I understand, under the orders of the Government of India, and I asked him for any suggestions he had to make, and this was the principal one he sent me, and I thought it a very valuable one.

16217. If it were possible for India to co-operate with some of the other Colonies, such as Ceylon or the West Indies, or other tropical colonies, in subsidising such a Chair so as to distribute the expense, it would seem to be a practical proposal?—I think it would be. I think it is very likely the proposal would be accepted, but I have no authority to say so.

16218. (By Professor Middleton.) The cost would be about three or four hundred pounds, I suppose?—Yes.

16219. What is the relation of the new college at Poona to the College of Science?—It is completely distinct; that is to say it has been a part of the College of Science, but now, under the new scheme it will be completely distinct.

*16220. Is the new College of Agriculture affiliated to the university of Bombay?—The proposal has been put before the university and, no doubt, it will be accepted.

*16221. So that the students trained at the college at Poona will graduate at the university of Bombay?—Yes.

*16222. Are they at present able to graduate?—Yes, they are.

*16223. Then it must be affiliated?—As a branch of the College of Science it was affiliated; but now the university have to accept and consider the new proposal. I think the new College of Agriculture should be affiliated.

*16224. And that is being done or is in process of being considered?—It is in process of being considered.

16225. You said you were not aware whether you had any serious difficulty in securing teachers or experts for India?—I have no knowledge of that.

16226. But you know that these experts have come from chiefly two institutions in this country?—Yes.

16227. If India is prepared to spend such a large sum in developing agriculture it shows that it recognises the need for these men?—Certainly.

16228. Therefore, in your opinion, India might do something towards the training of a suitable class of man for this work—that is your personal opinion I understand?—Do you mean towards providing the readership?

16229. Yes, so that the men who have to go out to India as experts should have some preliminary training before they enter on their duties?—Yes.

16230. (By the Chairman.) Is there any preliminary examination or entrance examination to the college at Poona?—Yes, the students have passed what is called the previous examination; that is the first year's course of the ordinary arts course, which leads to the degree of Bachelor of Arts.

16231. Do you think that is a wise course to take?—Yes, certainly. Without that they would not know enough English to attend the lectures.

16232. Do they pay fees there?—Yes, but there are a number of scholarships.

16233. A number of scholarships by the Government?—Yes, but the majority pay some small fee. I could not say what it is, but it is something very small.

16234. Of course, the college is entirely supported by the Government?—Yes, entirely.

16235. And a diploma is given at the end of the course?—Yes.

16236. It is a three years' course, is it not?—Yes.

16237. How is the examination conducted—by the personnel of the college?—No, the university appoints examiners.

16238. But do they take into account the work done at the college?—Do the examiners take that into account?

16239. Yes.—They ought to do so, and I presume they do.

16240. That is what I mean. Do they take it into account, and do they see the work that he has done in the laboratory?—No.

16241. The candidate is passed by them on the actual examination?—Yes.

16242. And nothing else?—Yes.

16243. (By Professor Middleton.) But they must be certified to have taken some special course in the college first, and to have attended certain laboratory classes?—Yes.

16244. So that the work done at the college is immediately under the control of the University of Bombay in that way?—Yes.

*Mr. Mead also supplied the following:—

16220-4. The Agricultural College, as distinct from the College of Science, has been affiliated to the University of Bombay.

Mr. H. S.
Lawrence.
19 Feb., 1908

16245. (*By the Chairman.*) Are there any students coming from the native States?—Yes.

16246. In the native States is anything done for the promotion of agriculture? Of course, in Baroda we know there is; but in Kathiawar, for instance, have any of the native States appointed a director of agriculture of their own?—No. There is no other director of agriculture that I know of except the one in Baroda. But some of the native States do have farms or gardens of their own.

16247. Experimental gardens?—Yes.

16248. Is there one at Bhawnagar?—No, but Gondal has one.

16249. Of course, in regard to cotton and sugar and so on, experiments are of great importance?—Yes.

16250. And they are having an immediate influence on the crops?—Yes.

16251. And on the whole condition of the growing of those crops?—Yes.

16252. Is there any bulletin published in India on the results of the research at Pusa; do they publish anything?—Yes, there is a quarterly journal published by the Pusa Institute.

*16253. And are any associations formed amongst the agriculturists themselves, or is there anything done in that direction, such as our farmers' clubs?—There is one that has been in existence in Bombay for twenty-five years, at Nadiad.

16254. In Gujerat?—Yes.

16255. A good deal of tobacco plant is cultivated there?—Yes.

16256. Is that tobacco plantation going to be successful?—I am afraid it has not been successful in obtaining tobacco for European consumption.

16257. But do they still attempt it, or has it disappeared?—A good deal of tobacco is grown for native consumption in Nadiad, and also there is an agricultural association at Dharwar.

16258. That is of native landowners?—Yes.

16259. And not official in any way?—The collector is the official president.

16260. But it is an independent association?—Yes.

16261. Do they collect contributions?—Yes.

16262. Do they organise shows?—They have not done so yet that I know of.

16263. Of course, we know there are shows in the south Mahratta country?—Yes.

16264. And they are very important as to the influence they exercise?—Yes. There are the cattle shows, for example, that you mean?

16265. Yes, and they exercise a very good influence?—Certainly.

16266. Is the agricultural education in Bombay under the Department of Agriculture, or under the Department of Education?—In all the provinces of India, I understand, it is under the Department of Agriculture. In Bombay, the Director of Public Education has been associated with the Director of Agriculture in joint control, but that was practically a private arrangement between myself and the Director of Public Education, because I wished to have his advice in various matters of the educational code which cropped up; but it was understood that the arrangement was personal to us two, and would probably be revised as soon as new officers came into those two posts.

16267. It was temporary?—Yes.

16268. Is there a registrar for the native co-operative societies in Bombay?—Yes.

16269. But you say that that has not been developed much lately?—No, I think not on a large scale.

16270. You have not got 50,000 co-operators, as in the North-West?—No.

Mr. Mead also forwarded the following notes:—

16271. On the general question of the provision of experts for the vast amount of scientific work waiting to be done in India, it appears probable that for many years to come reliance must be placed on Universities like Cambridge and Oxford for these higher posts, which demand originality in research work with power of organisation and administrative ability.

16272. Further, it appears highly desirable that the present European experts employed should be given opportunities for keeping their knowledge up to date. If they could periodically be granted "study leave" and could add to their present experience of Indian conditions a knowledge of the best scientific work done at some great centre of scientific research, their usefulness would be greatly increased.

Mr. W. H. MORELAND, C.I.E., called and examined.

Mr. W. H.
Moreland.
19 Feb., 1908

16273. (*By the Chairman.*) You are Director of the Department of Land Records and Agriculture in the United Provinces?—Yes.

16274. Will you just tell the Committee what the work of the Director of Agriculture is?—You do not, of course, want to know about the miscellaneous work, the compilation of statistics, and so on?

16275. No.—On the strictly agricultural side of the Director's duties he has, speaking generally, to do what he can to help an enormous number of small cultivators, and he has to do this, firstly, by study and experiment, and, secondly, by demonstration. Those two categories are, I suppose, common to all agricultural departments throughout the world. But, thirdly, having experimented and having demonstrated, he has to help the small cultivators to make use of any new thing that he puts before them. That, I think, is probably the chief differentia of the work in India from work in western countries.

16276. What have you to say with regard to banks?—They are still in the experimental stage in our Provinces. I am not in charge of what is known as the Department of Co-operative Credit, but that is in very close touch with the Director of Agriculture, and according to the latest figures I see there are now about 50,000 individuals in the provinces interested in co-operative credit societies of one kind or another. But still, 50,000 is a very small number out of a population of nearly 50,000,000, which we have to

consider. So that, as I say, the work is experimental, but the experiment is hopeful, and I believe myself that it is pretty certain that in time we shall evolve a definite system under which the best of the small cultivators will be able to finance themselves; not all the cultivators, but the bulk of them and the best of them. I do not think there is anything special in our methods that would interest the Committee. We have been working so far tentatively, beginning on Raiffeisen lines and adapting them as we go along.

16277. Has the impulse with regard to co-operation been given by the Government?—The impulse came entirely from the Government, and even now the greatest difficulty is found in getting people to do the propaganda work. We make the best of our cultivators understand exactly what a co-operative society is, and they want to take it up at once. But the difficulty is to get people to help in the work of bringing home to the people what a co-operative society is.

16278. That being so, how is it made clear to them?—It has been done mainly by the Registrar and his staff—he has a salaried staff of young Indians, educated men, whom he appoints and sends out to teach. But now the movement is certainly beginning to propagate itself by example. That is to say, if there is a bank in one village, and another village is near them, the latter begin to come in and say "We want a bank, too." That is the most hopeful sign of the movement.

**Mr. Mead also supplied the following:—*

16253. Several local associations which have been formed have shown considerable interest in agricultural affairs. The question of employing such associations for the purpose of collecting and disseminating information on agricultural matters amongst the cultivating classes is at present engaging the attention of the Government.

16279. Does the Government advance any money to those co-operative banks?—A certain amount; I cannot say exactly how much. It is under certain limitations, but I have not got a note of them here. The Government lends a certain amount on condition, if I remember rightly, of a larger amount being raised independently of the Government.

16280. You say that there is a special official charged with the duty of supervising this co-operative movement?—Yes; under the law he is the Registrar of Co-operative Credit Societies and is required to register societies of which the bye-laws are in accordance with the law. But entirely apart from his legal duties he is expected to be the impetus at the back of the whole movement, not only for credit but for co-operation in agriculture, independently of credit.

16281. Is he a civilian?—He is a civilian. I do not think the post is limited to civilians, but as a matter of fact he is a civilian.

16282. And he has special knowledge of co-operation?—He has no previous special knowledge of co-operation; but, of course, when the post falls vacant he is selected with some care. He knows the people and their circumstances, and also knows how the co-operative movement has started in India.

16283. Is there a special Act for the co-operative societies?—There is.

16284. Is that an Imperial Act?—Yes.

16285. Of what date, do you remember?—1904 or 1905.

16286. As late as that?—Yes, I think so.

16287. Is there any other part of India where the co-operative movement is so advanced as it is with you?—I cannot speak definitely for other parts of India, but there is a registrar in every larger province, and they are all doing something towards developing it in different directions.

16288. Then, to turn to agriculture, you have in some parts of India large land proprietors?—Yes, a large proportion of land proprietors.

16289. Have you been successful in the United Provinces in getting the zemindars to send their sons, and are they aware of the importance of sending their sons to agricultural colleges?—Not yet. I am not so hopeful as I was a few years ago that any considerable number of them will do so. The most to expect is that one here or there will come, because it means you will first have to educate the landholders themselves, and in the social conditions prevailing in our Provinces a landholder to begin with does not want to have a son educated at all; but when the desire for education comes, then he wants a liberal education to turn his son from being a landholder's son into a Government official. The time may come when he will long to turn his son from being an uneducated landowner into an educated one, but that is not in sight yet.

16290. Have they got managers for their estates, or do they manage them themselves?—There are a large number of them who manage through others. That is, of course, the main point where I hope the agricultural college will justify its existence, apart from its first function of "staffing" a Government Department. The thing is to create a profession of trained land agents, which, as a matter of fact, does not exist in the country at the present time. At the present time a landlord who wants a man trained in the knowledge of the country has no place to look for him.

16291. In the United Provinces, as in Bombay, in recent years have you found a greater desire to spend money on agricultural education and on the development of agriculture?—By whom do you mean?

16292. By the Government?—The position is entirely changed. Up to a few years ago you could not get money for anything, but in our Provinces our financial history is a matter which I should not trouble this Committee with. It has been such that nobody has had any money to do anything with, and as a matter of fact what money there is now is given by the Imperial Government and is earmarked for this purpose at the time it is given. But the change in our Provinces dates from the time when Sir Anthony MacDonnell came back from the famine commission of 1900-1. Sir Anthony MacDonnell came back from that commission convinced that as part of the measures of the famine policy it was essential to have a strong agricultural department.

16293. (*Mr. Lamont.*) One question with regard to the co-operative societies. Are they co-operative for the sale of produce and for the purchase of commodities as well as for banking?—It has not got to that stage yet. I am speaking of the whole thing as very experimental. As far as we can judge there are fewer obstacles in the way of beginning with credit than with other objects; but I have assisted in founding some societies for the supply of pure seed, as a beginning, and I heard recently of one society which assists its members by buying grain at harvest and selling it later on. If you know India you know the tremendous difference between harvest prices and other prices, and one of the most promising societies, which originated purely as a credit society, has begun to employ its funds in purchasing the grain at harvest time and selling it six months later at the best prices which could be got. But speaking generally, supply societies and produce societies are hardly started in our Provinces.

16294. (*By the Chairman.*) The main object, as you have stated, is credit?—Yes, credit is the first thing. If once the people get into the habit of clubbing their credit for any purpose the rest will come very easily.

16295. (*By Professor Middleton.*) Where is your teaching institution in the United Provinces?—Cawnpore.

16296. Is it an agricultural college or a high school?—It is now a college. It began as a school in 1893, and it is now in its second year as a college.

16297. How many Europeans do you employ on the staff?—We have a staff of three, a principal and a chemist and a botanist. The chemist and botanist are mainly expected to do research and organisation. The actual teaching is to be done by Indians, at least the great bulk of it, but under the direction of Europeans.

16298. Then attached to the college you have an experimental farm or garden, have you not?—The experimental farm we have is separated from the college; it is near the college, and the higher classes can be instructed in the experiments there, but it is under separate management from the college. We have an instruction farm where the senior agricultural lecturer (an Indian), carries out agriculture to make a profit, and is allowed 50 per cent. of the profits.

16299. What is his name?—Mr. Patwardhan, one of your old pupils. But that is purely an instruction farm with no more experiment than a farmer should carry out.

16300. (*By the Chairman.*) Will you give us your view as to whether agricultural education should be under the Agricultural Department or under the Education Department?—In the United Provinces it was decided that it should be under the Agricultural Department. I do not think that I am prepared at the present moment to give a reasoned statement of my views; it was a matter of discussion, and it was considered at some length. But it is the sort of thing I should prefer to make a statement of my reasons in writing about. I hold that the Agricultural Department is the right department, provided that the Director of the Agricultural Department can work in harmony with the Education Department and take advice and assistance from them when he wants it.

16301. Will you put that down in writing?—I put a paragraph bearing on the subject at the end of the note I handed in. I say "The Director's position in regard to the Agricultural College is analogous to that of a governing body, but he is authorised to consult the Director of Public Instruction on matters of educational concern." That is the official phrase, "he is authorised to consult." As a matter of fact the Director of Public Instruction and I discuss any matter of importance on the educational side of it quite informally, but the decision is mine.

16302. You are prepared to argue the advantages of that arrangement?—I am not prepared to argue it in the time left to me now.

16303. But you could just give us an epitome of your views?—On the question of control?

16304. Yes.—And the reasons?

16305. Yes.—I will try to do it before I go.

16306. The Committee would like to have your opinion about it, as it is rather an important question for them?—I will forward a statement on the subject. [*The witness subsequently forwarded a memorandum stating the reasons why the Cawnpore Agricultural College was placed under the control of the Agricultural Department.*]

Mr. W. H.
Moreland.
19 Feb., 1908

The following is a copy of a letter received from the Hon. Secretary of the Agricultural Education Association:—

Midland Agricultural and Dairy College,
Kingston, Derby.

January 29th, 1906.

SIR:

I have been instructed to forward to you, for the information of the Committee, an account of the constitution, membership and objects of the above Association, together with a copy of the Rules and list of present members.

CONSTITUTION.

The Association was constituted on October 11th, 1894. Originally it consisted of the heads of agricultural departments in English and Welsh colleges; but in 1901 its constitution was considerably enlarged, and it now consists of members of any organisations or institutions connected with agricultural education or research who themselves are, or have been, engaged in teaching or research.

At present the Association consists of members of the teaching staff of every agricultural department or college in Great Britain, together with others connected with institutions in Ireland and the Colonies who are officially interested in agricultural education.

MEMBERSHIP.

When constituted, the Association had eight members. At the present time the membership is one hundred and five, representing forty-five departments and institutions.

The following is a list of the departments, colleges or local bodies one or more of the members of which are now members of the Association:—

Board of Agriculture.
Board of Education.
Department of Agriculture and Technical Instruction for Ireland.
Experimental Station, Rothamsted.
University of Aberdeen.
University of Cambridge.
University of Edinburgh.
University of Leeds.
University College of Wales, Aberystwyth.
University College of North Wales, Bangor.
Royal College of Science, Dublin.
Armstrong College, Newcastle-upon-Tyne.
University College, Reading.
South-Eastern Agricultural College, Wye, Kent.
Midland Agricultural and Dairy College, Kingston, Derby.
Agricultural College, Aspatria.
Royal Agricultural College, Cirencester.
Harper-Adams Agricultural College, Newport, Salop.
College of Agriculture and Horticulture, Holmes Chapel, Cheshire.
University College, Bristol.
Agricultural Institute, Ridgmont, Beds.
Agricultural and Horticultural College, Uckfield, Sussex.
Edinburgh and East of Scotland College of Agriculture, Edinburgh.
West of Scotland Agricultural College, Glasgow.
National Fruit and Cider Institute, Long Ashton.
Dauntsey Agricultural School, West Lavington, Devizes.
Hampshire Farm School, Basing.
Cumberland and Westmorland Farm School, Newton Rigg.
Devonshire County Council, Agricultural Department.
Dorsetshire " " "
Essex " " "
Gloucestershire " " "
Herefordshire " " "
Lancashire " " "
Monmouthshire " " "
Somersetshire " " "
Staffordshire " " "
Royal Agricultural Society of England.
Agricultural Organisation Society.
Transvaal Department of Agriculture, Pretoria.
Government College of Agriculture, South Australia.
Government College of Agriculture, Cape Colony.
Government College of Agriculture, Poona, India.
Department of Agriculture for India.
Agricultural Research Institute, Pusa, Bengal.

The Association may thus claim to be a body of experts in agricultural education.

OBJECTS.

The object of the Association, as defined by the Rules, is the development of agricultural education and research by mutual assistance and advice among the members. It endeavours to attain that object by frequent discussion and intercourse, and thus to promote co-operation and uniformity of action among the institutions concerned as regards educational questions, field experiments, research, publication of results, and other matters where agreement is desirable, without interfering with the individuality or local needs of each institution. It is also always ready to assist and advise public bodies dealing with matters relating to agricultural education.

WORK.

The Association holds a summer and a winter meeting in each year. The summer meeting takes the form of a conference and is held at some centre of agricultural interest. For example, the last five summer meetings have been held respectively at the South-Eastern Agricultural College; the Armstrong College; the University of Cambridge; Agricultural Research Station, Rothamsted; and Royal Agricultural Society's Research Station, Woburn; the West of Scotland Agricultural College; and the Midland Agricultural and Dairy College. At these meetings every opportunity is afforded the members of inquiring into the system of management of the college or station visited, and a number of papers relating more particularly to recent research in agricultural science are read and discussed.

The Association has carried out an extensive scheme of Crop Rotation Trials, the results of which were published by the Board of Agriculture; and has formulated and printed recommendations on such subjects as the following:—

- (a) Chemical Analysis of Soils on uniform basis.
- (b) Mechanical Analysis of Soils on uniform basis.
- (c) Field Experiments on the Manuring of Crops on a uniform basis.
- (d) Joint Experiments on the Winter Feeding of Dairy Cows.
- (e) Joint Experiments on the Summer Feeding of Dairy Cows.
- (f) Joint Experiments to test Seed Mixtures for Permanent Grass.
- (g) Joint Experiments to test the efficacy of inoculating material on Beans and Clover.

The Association has on several occasions been consulted by the Board of Agriculture.

The Association assisted the Board of Education in revising the Agricultural Syllabus of that Department.

The Association has on several occasions been in communication with the Joint Education Board of the Royal Agricultural Society and the Highland and Agricultural Society as to the method of carrying out the examination for the National Diploma in Agriculture.

It was mainly at the instigation of the Association that the Royal Agricultural Society instituted the Agricultural Education Exhibitions at their Annual Show, and the Association uses its best endeavours to make these annual exhibitions successful and of interest and usefulness to the agricultural community. In this exhibition it yearly provides, at its own expense, a stand for the distribution of the agricultural literature published by the institutions it represents.

FINANCES.

The Association's income at the present time is about £50 per annum, derived entirely from members' subscriptions. This income is spent in printing and circulating the results of its deliberations and in the clerical and other expenses involved by the Association's meetings.

I am,
Sir,

Your obedient Servant,
J. F. BLACKSHAW,
Hon. Secretary,
Agricultural Education Association.

To the Secretary,
Departmental Committee on Agricultural Education.

LIST OF THE PRINCIPAL HEADINGS AND SUB-HEADINGS UNDER WHICH THE EVIDENCE IS CLASSIFIED IN THE FOLLOWING INDEX.

-
- ABERYSTWYTH, UNIVERSITY COLLEGE OF WALES.
 ADVICE AND ASSISTANCE GIVEN TO ADULT FARMERS.
 AGRICULTURAL EDUCATION ASSOCIATION.
 AGRICULTURAL EDUCATION COMMITTEE.
 ANALYSES.
 ARMSTRONG COLLEGE, NEWCASTLE-UPON-TYNE.
 ASPATRIA AGRICULTURAL COLLEGE, CARLISLE.
 ATTITUDE OF AGRICULTURISTS TOWARDS—
 Agricultural Education generally.
 Instruction provided by the various colleges,
 counties, &c.
 Relationship between science and practice.
 BANGOR, UNIVERSITY OF NORTH WALES.
 BASING, HAMPSHIRE FARM SCHOOL AT.
 BATH AND WEST AND SOUTHERN COUNTIES SOCIETY.
 BERKSHIRE.
 "BIGOD'S HALL," COUNTESS OF WARWICK'S SCHOOL AT
 DUNMOW.
 BIRMINGHAM, UNIVERSITY OF.
 BOARD OF AGRICULTURE AND FISHERIES :
 Educational Branch.
 Honorary Agricultural Correspondents.
 Intelligence Branch.
 Publications.
 BOARD OF EDUCATION :
 Agricultural Work of County Councils.
 Elementary Schools.
 Grants.
 Higher Elementary or Secondary Schools.
 Technical Classes or Institutions.
 BREDON'S NORTON, SCHOOL OF GARDENING AT.
 BRISTOL UNIVERSITY COLLEGE.
 BRITISH BEE-KEEPERS' ASSOCIATION.
 BRITISH DAIRY INSTITUTE, READING.
 CAMBRIDGE, UNIVERSITY OF.
 COLONIAL AND FOREIGN COUNTRIES, AGRICULTURAL
 EDUCATION IN :
 Australia. Austria. Belgium. Canada. Denmark.
 France. Germany. Holland. Hungary. India.
 Italy. New Zealand. United States. West
 Indies.
 CO-OPERATION, AGRICULTURAL.
 COUNTY COUNCILS, WORK OF THE.
 DAUNTSEY AGRICULTURAL SCHOOL, WEST LAVINGTON.
 DORSET.
 EASTERN COUNTIES DAIRY INSTITUTE, IPSWICH.
 EFFECT AND VALUE OF AGRICULTURAL EDUCATION.
 ELEMENTARY SCHOOL TEACHERS :
 Instruction or Training in Rural Subjects.
 Provision for such Training.
 ESSEX COUNTY TECHNICAL LABORATORIES.
 EXAMINATIONS :
 National Diploma Examinations :
 Agriculture.
 Dairying.
 EXPENDITURE UPON AGRICULTURAL EDUCATION :
 Board of Agriculture :
 Grants from, to agricultural institutions.
 Support given by, to County Councils.
 County Councils.
 Institutions providing agricultural instruction.
 EXPERIMENTS OR DEMONSTRATIONS :
 Demonstrations for farmers.
 Need for increase of experiments or experimental
 work.
 Co-ordination of Experiments :
 Manurial scheme prepared by the Agricultural
 Education Association.
 FARMING, KNOWLEDGE OF PRACTICAL.
 System of apprenticing lads to farmers or land-agents.
 Whether an agricultural student should obtain his
 knowledge of practical farming before or after his
 college course.
 FARRIERS, WORSHIPFUL COMPANY OF.
 GLOUCESTERSHIRE.
 HARPER-ADAMS AGRICULTURAL COLLEGE, NEWPORT,
 SALOP.
 HEREFORD.
 HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.
 HOLMES CHAPEL, CHESHIRE, COLLEGE OF AGRICULTURE
 AND HORTICULTURE AT.
 INSTITUTIONS PROVIDING INSTRUCTION IN AGRICULTURE :
 Higher Agricultural Institutions.
 Minor Agricultural Institutions :
 Agricultural Schools.
 Farm Institutes or Farm School.
 Short Agricultural Courses.
 IRELAND.
 LABOURERS.
 LANCASHIRE :
 Harris Institute.
 Hutton Farm.
 LECTURES, AGRICULTURAL :
 Audience.
 Lecturer.
 Local Organisation.
 Subject of.
 Value of.
 LEEDS, UNIVERSITY OF.
 MANCHESTER, VICTORIA UNIVERSITY OF.
 MIDLAND AGRICULTURAL AND DAIRY COLLEGE, KING-
 STON, DERBY.
 MONMOUTH.
 NATIONAL FRUIT AND CIDER INSTITUTE AT LONG ASHTON,
 NEAR BRISTOL.
 NEWTON RIGG, CUMBERLAND AND WESTMORLAND FARM
 SCHOOL AT.
 NORFOLK.
 NORTH-EASTERN COUNTY SCHOOL, BARNARD CASTLE.
 ORGANISATION AND CONTROL OF AGRICULTURAL EDUCA-
 TION.
 Agricultural Societies.
 County Councils.
 Extent of the provision of Agricultural Education.
 Government Department or Central Authority.
 Board of Agriculture and Fisheries.
 Board of Education.
 Institutions, Agricultural.
 Most suitable unit for purposes of agricultural educa-
 tion.
 Permanent Consultative Committee.
 OXFORD, UNIVERSITY OF.

PREVIOUS EDUCATION :

Continuation Classes.
 Elementary.
 Nature Study.
 Of student attending various agricultural colleges.
 School gardens.
 Secondary.
 Character of the education at secondary schools.

READING UNIVERSITY COLLEGE.

RESEARCH :

Control of.
 Encouragement by the State.
 Importance and appreciation of.
 The need for further.
 Where, and by whom, research should be conducted.

RIDGMONT AGRICULTURAL INSTITUTE, BEDFORDSHIRE.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

ROYAL HORTICULTURAL SOCIETY.

ROYAL METEOROLOGICAL SOCIETY.

ROYAL VETERINARY COLLEGE, LONDON.

SCHOLARSHIPS :

Amount of.
 Policy of giving.

SCOTLAND

SOMERSET.

SOUTH EASTERN AGRICULTURAL COLLEGE, WYE.

STAFF, AGRICULTURAL, OF COLLEGES AND COUNTY COUNCILS:

Demand for.
 Qualifications of.
 Salaries of.
 Training of.
 Travelling scholarships.

STUDLEY HORTICULTURAL COLLEGE, WARWICKSHIRE.

SUBJECTS OF INSTRUCTION.

Agricultural History or Economics. Agriculture.
 Bee-keeping. Biology. Chemistry. Cidermaking.
 Dairying. Drawing. Farriery. Forestry. Geology.
 Horticulture. Manual Processes. Meteorology.
 Poultry-keeping. Veterinary Hygiene.

SURVEYORS' INSTITUTION.

SUSSEX, WEST.

SWANLEY HORTICULTURAL COLLEGE, KENT.

UCKFIELD, AGRICULTURAL AND HORTICULTURAL COLLEGE
 AT.

VETERINARY EDUCATION.

WILTSHIRE.

WOMEN, INSTRUCTION IN AGRICULTURE AND HORTICUL-
 TURE FOR.

WORCESTER.

WORLESTON DAIRY INSTITUTE, CHESHIRE.

GENERAL INDEX OF THE MINUTES OF EVIDENCE.

ABERYSTWYTH, UNIVERSITY COLLEGE OF WALES.

Evidence received principally from (Roberts) 8102-8248; (Davies) 8249-8404.

Analyses (Davies) 8256f, 8257, 8283, 8326-7; (Roberts) 8111r, 8112-3a, 8113m.

Bangor, relations with, *see under* Bangor.

Boundary between, and Bangor at present inconvenient (Dugdale), 4958-9, 5011-2.

Comment upon (Pennant) 6612-5; (Roberts) 8192-6.

Counties which support the College and amount of their contributions (Roberts) 8111b, 8117-8, 8152-4.

Relations with (Roberts) 8189-221.

Distribution of reports, &c. (Roberts) 8111n.

Glamorgan, connection with (Roberts) 8119c.

Governing body (Roberts) 8111, 8111c, 8241-4.

History of the formation of the Agricultural Department and chronological sketch of the extension and development of its work (Roberts) 8105-6, 8109-19.

Attitude of Agriculturists towards, see that title.

Courses of Instruction (Davies) 8340-4, 8401; (Roberts) 8111c, j, l, o, p, 8113i, 8113n-8114, 8150-1, 8227-34.

Elementary school teachers, *see that title.*

External Work :

Dairying (Davies) 8256c, 8305-8; (Roberts) 8111e, g, i, k, o.

Experiments (Davies) 8271, 8279; (Roberts) 8111h, l, 8113g.

Horticulture (Davies) 8269-70; (Roberts) 8113c, l, 8119a, b, 8222.

Lectures (Davies) 8256b, 8309-14, 8318-21; (Roberts) 8111e, h, 8138.

Made difficult owing to defective means of communication (Roberts) 8111d.

With regard to co-operation (Davies) 8282; (Roberts) 8111n, 8113j, 8114c.

Farm (Davies) 8271-8, 8299-303, 8114c-6; (Roberts) 8223, 8240.

Finance :

Require further assistance from national funds, especially for the more advanced work (Roberts) 8111c, 8119d, 8119n-8128, 8167-70, 8218.

Sources of income (Roberts) 8111a, b, e, 8133-6, 8187-8.

Scholarships tenable at (Davies) 8256d, 8263-7, 8297-8, 8344-6, 8374-5, 8377-85, 8390; (Roberts) 8111f, 8155-9.

Need of, for more advanced and longer courses (Roberts) 8128, 8164.

Students :

Agricultural Association (Roberts) 8111p, 8113b, 8113g, 8114b, c.

Fees and cost of maintenance (Roberts) 8135-7.

Influence exerted by old, on the agriculturist of the counties (Davies) 8256e, 8392-3, 8176-82.

Number of (Roberts) 8114a, 8163-4, 8175.

Previous education of, *see that title.*

Residential accommodation for (Roberts) 8224-6, 8238.

Type of student and their after careers (Davies) 8263-8, 8333-9, 8344-52; (Roberts) 8111m, 8113e, f, 8129-32, 8135, 8160-3, 8227, 8235-7.

Staff (Roberts) 8111a, g, 8113b, 8119d, 8149.

Majority of, must be able to speak Welsh (Roberts) 8143-4.

ACLAND, SIR C. T. DYKE, Bart., Nominated by the Bath and West and Southern Counties Society.

Evidence, 2617-2926.

ADVICE AND ASSISTANCE GIVEN TO ADULT FARMERS.

Assistance by correspondence is appreciated (Amos) 916-8.

Benefit to farmer for instructor to visit him at his farm (Amos) 904.

Dissemination of literature is not sufficient unless it is done personally (Lodge) 5482.

Farmers appreciate no form of instruction more than personal visits and advice (Brockholes) 13683-9.

Farmers' institutes (Brown) 6171b; (Craigie) 13218-13220.

Farmers need definite information upon points they are interested in (Hale) 13299-302, 13311; (T. H. Middleton) 15459b; (Sutton) 4071-5; (Turnor) 14298-9.

Farmers prefer advice given on the land (Collinge) 5051-2.

In conducting experiments for themselves (Percival) 4292-3, 4297.

Need of more effective distribution of agricultural literature (Fisher) 3036-9; (Gilchrist) 520-1; (Weiss) 8947-51.

Spread of information very desirable (Simmons) 8608-11.

Teaching which is conveyed to adult farmers, by means of demonstration plots and personal visits is one of the most beneficial forms of instruction (Craigie) 13178c.

There should be attached to central institution one man, with county for unit, whose sole duty it would be to advise and assist farmers (Eve) 12993, 13008, 13051-7, 13096-100.

Useful work could be done by teachers visiting labourers and farmers (Brown) 6273-7.

Value of the agricultural article in local papers (Dugdale) 5018.

AGRICULTURAL AND HORTICULTURAL COLLEGE, UCKFIELD. *See under* Uckfield.

AGRICULTURAL CLUBS FOR VILLAGE LADS

(Carrick) 494-9; (Turner) 7899-902, 7928-30, 8012-6, 8047-8.

AGRICULTURAL COLLEGES. *See under* Institutions.AGRICULTURAL EDUCATION ASSOCIATION. *See* page 606.

Aim of (T. H. Middleton) 15460c.

Experiments, co-ordination of, *see under* Experiments.

Ought to be assisted and encouraged by the Government (Campbell) 11184b-9, 11220-4.

Some means might be devised for making more use of (T. H. Middleton) 15460d.

Work of the (Foulkes) 5793-5, 5900-2.

AGRICULTURAL EDUCATION COMMITTEE.

Did useful work (Percival) 4362-3.

Objects of, and main lines of action (Hobhouse) 14924-6, 14928, 15075-6.

Resolutions adopted by, as to the organisation of agricultural education (Acland) 2831-3.

AGRICULTURAL HISTORY OR ECONOMICS. *See under* Subjects of Instruction.

AGRICULTURAL LIBRARIES, PROVISION OF

(Dugdale) 5018-9; (Hogben) 14121-4; (Household) 8099; (Peet) 12480-2; (Turnor) 14440-3.

• AGRICULTURAL SCHOOLS. *See under* Institutions.

AGRICULTURAL SOCIETIES, EDUCATIONAL WORK OF. *See under* Organisation.

AGRICULTURE. *See under* Subjects of Instruction.

ALLTOFT, Mr. P. *Instructor in Manual Processes in the Lindsey Division of Lincoln and Wiltshire.* (Qualifications of Witness, *see* 10602-7, 10640, 10660-1.)

Evidence, 10599-10758.

AMOS, Mr. A. *A Governor and Chairman of the Farm Committee of the South-Eastern Agricultural College, Wye.*

Evidence, 882-950.

ANALYSES.

For information as to the number, &c., of analyses carried out by any institution or county, see under the particular institution or county.

At agricultural colleges, are not always carried out by competent analysts (*Voelcker*) 13987, 14017-8, 14021-9, 14031-7.

Charge should be made for (*Mannington*) 2148-9.

College gets into touch with farmers by means of analyses (*Foulkes*) 5786-8.

Deprecates public money which is given for educational purposes being used to supply farmers with cheap analyses (*Voelcker*) 13986-91, 14013-6, 14019-20, 14024-6, 14037-9.

Farmers prefer analyses from educational institutions • because with the analysis they receive advice (*Nicholas*) 1188-9, 1203-7; (*Steel*) 1184-7.

Farmers welcome the opportunity of obtaining information privately (*Burne*) 5570-2; (*Foulkes*) 5786-8.

Milk-testing scheme prepared by the Board of Agriculture, *see under* Board of Agriculture and Fisheries, Intelligence Branch.

To secure the interest of farmers it is necessary to offer information of definite use, *e.g.*, analyses (*Percival*) 4229a.

Would advocate giving farmers further facilities for obtaining analytical information (*Foulkes*) 5855-6.

Would rather not undertake legal analyses because the presence of a member of a college in the law courts is not advisable (*Dunstun*) 823, 853-5.

ANIMAL HYGIENE. *See under* Subjects of Instruction—Veterinary Hygiene.

ARMSTRONG COLLEGE, NEWCASTLE-UPON-TYNE.

Evidence received principally from (Carrick) 315-516; (Gilchrist) 517-750.

Advice and assistance given to farmers and others (Carrick) 434-5; (Gilchrist) 530, 682-5.

Bulletins distributed (Gilchrist) 614-21, 714, 717.

Counties which support, influence exerted over (Gilchrist) 725-9.

Cumberland and Westmorland Farm School, *see under* Newton Rigg.

Governing body (Carrick) 319-20, 400-4; (Gilchrist) 623-4, 653-6.

Attitude of Agriculturists towards, *see that title.*

Courses of instruction (Carrick) 436-7; (Gilchrist) 534-9, 550-1, 563-7, 643, 703-11, 744-5.

Dairying, instruction in, requires developing (Gilchrist) 528a, 648, 663, 690-1.

Elementary school teachers, *see that title.*

External Work :

Cockle Park Farm (Carrick) 339-42, 372-9, 454-63.

Experimental work (Gilchrist) 572-5.

Needs developing (Gilchrist) 529, 531.

Horticulture (Gilchrist) 718-20; (W. T. Lawrence) 7438.

Lectures (Carrick) 344-7, 441-5; (Gilchrist) 568-71, 612-4, 667-9, 686-7.

Offerton Dairy Station (Carrick) 363-5, 379-85, 515-6; (Gilchrist) 528.

Armstrong College, Newcastle-upon-Tyne—*cont.*

Finance :

Additional funds, need of (Carrick) 338; (Gilchrist) 562, 567, 648.

Financial position (Gilchrist) 595-603, 622-3.

Sources of income (Carrick) 335-7, 395-9.

Grant from Northumberland County Council may be reduced (Carrick) 391-3.

Forestry Department (Carrick) 361-2, 408-9; (Gilchrist) 626-38.

Research Work conducted (Gilchrist) 721-3.

Scholarships tenable at (Gilchrist) 554.

Staff (Carrick) 388-9; (W. T. Lawrence) 7438-9.

Inadequate (Gilchrist) 522-7, 556, 562.

Students :

Agricultural Students' Association (Gilchrist) 717a.

Cost of instruction and residence (Gilchrist) 644-5.

Number of (Gilchrist) 664.

Previous education of, *see that title.*

Type of students and their after-careers (Carrick) 324-5, 356-7, 438-40; (Gilchrist) 557-61, 646-7, 665-7, 712-3.

ASHCROFT, Mr. WM. *Chairman of the Joint Committee of the British Dairy Institute, Reading.*

Evidence, 2336-2490.

ASPATRIA AGRICULTURAL COLLEGE, Carlisle.

Evidence received principally from (Smith-Hill) 7442-7584.

Constitution of College has become altered as a result of the growth of County Council institutions (Smith-Hill) 7552-4.

To allow College to collapse would be a pity from a public point of view (Smith-Hill) 7520-39.

Courses of Instruction (Smith-Hill) 7473-6, 7480, 7481-5, 7491-9, 7506-7, 7511, 7543-5, 7547-8, 7555-6, 7571-84.

Financial Position and Prospects (Smith-Hill) 7452-6, 7520-5.

Staff (Smith-Hill) 7471-2, 7541-2.

Students :

Fees (Smith-Hill) 7465-7, 7557-9.

Number of (Smith-Hill) 7445.

Residential accommodation for (Smith-Hill) 7468-9.

Type of student and their after-careers (Smith-Hill) 7446-51, 7470, 7477, 7537-9, 7563, 7567.

ATTITUDE OF AGRICULTURISTS and of others engaged in Agricultural Industries, towards—

For information as to the opinions of agriculturists on particular subjects, e.g., External Lectures, Experiments, Analyses, &c., see under the particular heading.

*Agricultural Education generally :

Agricultural classes do not value very highly facilities for obtaining the highest form of agricultural instruction (Hobhouse) 14849-50.

Among farmers there is a feeling of dissatisfaction with agricultural education, owing chiefly to the fact that instructors have not gained their full confidence (Eve) 12975-83, 13101-10.

Are beginning to appreciate newer methods (Tinniswood) 7149-53.

Are slowly beginning to appreciate agricultural education (Wheeler) 6428, 6445-6, 6460-3.

Complete reversal of opinion (Pennant) 6506; (W. P. Wright) 10130-2.

Dairying, instruction in, has had a good effect on the attitude of farmers (Pennant) 6549-52.

Desire for agricultural education would be greater if a local man would take the lead (Peter) 9820-1.

Education will in the future be taken greater advantage of (Mannington) 2115-6.

Extent to which farmers are beginning to consult the local agricultural college (Lawrence) 7403-5.

Farmer is more interested in the education of his labourer than of his son (Inskip) 3420a.

Farmers used to doubt whether a scientific person could teach the practical man, but are now beginning to see that the combination of the two is of great benefit (Burne) 5616-7.

Feel that the information given to students at some agricultural colleges is of a mischievous nature (Collinge) 5068a

Attitude of Agriculturists and of others engaged in Agricultural Industries, towards—cont.

Agricultural Education generally—cont.

- Has been a great change in the (*MacDonald*) 11784-6; (*Turnor*) 14341-4.
- Larger farmers appreciate the value of agricultural education (*Kidner*) 6015-7.
- Larger farmers appreciate the value of agricultural education more than the smaller men (*McCracken*) 9275-6.
- More agricultural education is encouraged the more the appreciation of it will grow (*Bickersteth*) 2995.
- More and more appreciated (*Simmons*) 8607.
- Not sanguine that farmers will send their sons, after school days, away from farm for any long course (*Acland*) 2828-9.
- Recognise much more widely value of agricultural education (*Turnor*) 14397-8.
- Very anxious to learn (*Eve*) 12979.
- Very distinct change; largely due to the fact that the advice that they now receive is much more satisfactory (*Sutton*) 4018c, 4066-75.
- Why the sons of small farmers do not attend agricultural classes (*Mannington*) 2107-18.
- Wishes generally to have his son at home as soon as possible after leaving school (*Foulkes*) 5717-8.

Instruction provided by :

- Aberystwyth, University College of Wales (*Davies*) 8252-5, 8256b, 8262, 8276-9, 8304, 8309-14, 8398-9; (*Roberts*) 8138, 8162.
- Armstrong College (*Carrick*) 326, 343, 358-9, 382-5, 394, 454; (*Gitchrist*) 574-5, 619; (*Tinniswood*) 7191b.
- Bangor, University College of North Wales (*Pennant*) 6506, 6535-7; (*Winter*) 6653b, j, 6659j, 6879a.
- Basing, Hampshire Farm School at (*D. T. Cowan*) 5130-7, 5140-2, 5187-90, 5207a, 5212, 5264-5, 5283-6.
- Bath and West and Southern Counties' Society (*Kidner*) 6062.
- "Bigod's Hall," Countess of Warwick's School (*Hacking*) 6931c, 6979, 6982, 6984.
- Birmingham University (*Collinge*) 5035a-c, 5074; (*Lodge*) 5482-3.
- Cambridge University (*Sapwell*) 241c, d, 242-3, 259, 287-8, 291-3; (*Wood*) 27-8, 33, 160-1.
- Dauntsey Agricultural School (*Phipps*) 9086c.
- Devon County Council (*Acland*) 2686-7, 2717-40.
- Eastern Counties' Dairy Institute (*J. A. Smith*) 14511b, 14529-31, 14567-9.
- Essex County Technical Laboratories (*Goodchild*) 1067i; (*Nicholas*) 953d, 1195-7; (*Raby*) 1108-15.
- Gloucester County Council (*Turner*) 7785-6.
- Harper-Adams Agricultural College (*Dugdale*) 4899; (*Foulkes*) 5726-9, 5731-3, 5754-6, 5924-6.
- Hereford County Council (*Peet*) 12361-4, 12475, 12477; (*J. W. Smith*) 12194-6.
- Holmes Chapel College of Agriculture and Horticulture (*Hill*) 1449-51, 1469-72; (*McCracken*) 9220, 9225-6; (*Ward*) 4602-5, 4624-33; (*Young*) 1265-9, 1303, 1440-2.
- Lancashire County Council (*Brockholes*) 13681-8, 13704, 13706-8, 13770-8; (*Hale*) 13299-305, 13579-81.
- Leeds University (*Bickersteth*) 2933, 2934a, 2966-71, 3135-9, 3142-5, 3147, 3242-3; (*Fisher*) 3002-6, 3017-28; (*Seton*) 3054b, 3055, 3074.
- Midland Agricultural and Dairy College (*Blackshaw*) 1672-5, 1689-94, 1709a, 1831; (*Cope*) 1650-3; (*Turnor*) 14292-8.
- Monmouth County Council (*Grant*) 10324, 10341-3.
- National Fruit and Cider Institute (*Turner*) 7816-7818.
- Newton Rigg, Cumberland and Westmorland Farm School at (*Howard*) 7074-5; (*W. T. Lawrence*) 7393-4, 7403-7; (*Tinniswood*) 7119.
- Reading University College (*Eady*) 9365, 9374-9, 9384; (*Keeble*) 4414, 4420; (*Percival*) 4113-6, 4219-21; (*Simmons*) 8655; (*Sutton*) 4018a, d.
- Ridgmont Agricultural Institute (*Druce*) 3558-60, 3563, 3637-40, 3704-8; (*Eve*) 13022a, 13025; (*Inskip*) 3341-2, 3345-8, 3428-35, 3479-85.
- Royal Agricultural College, Cirencester (*Kidner*) 6079-106.
- Somerset County Council (*Hobhouse*) 14891-904, 14969-71, 4987-91; (*Kidner*) 6036-9.

Attitude of Agriculturists and of others engaged in Agricultural Industries, towards—cont.

Instruction provided by—cont.

- South-Eastern Agricultural College (*Amos*) 886, 890-1, 899-903, 907-10, 916-8, 923-4; (*Dunstan*) 801; (*Hall*) 1480-2, 1526; (*W. P. Wright*) 10177-82.
- Sussex, West, *see that title*.
- Uckfield Agricultural and Horticultural College (*Mannington*) 1980-2, 1999-2001, 2052, 2056; (*Woodhead*) 2181-2, 2208-10, 2270-2.
- Wiltshire County Council (*Fitzmaurice*) 7840d.
- Worcester County Council (*Wheeler*) 6428, 6445-6, 6490-3.
- Worleston Dairy Institute (*Ward*) 4492.
- Relationship between Science and Practice (*Burne*) 5616-7; (*Eady*) 9418-28, 9473-5; (*Eve*) 13166-8; (*Kidner*) 6053-66; (*Langridge*) 10950-6; (*Peter*) 9793-4, 9814-6, 9822-3, 9856-8; (*Sapwell*) 306; (*J. W. Smith*) 12298-300; (*Simmons*) 8642-52, 8727-9; (*Stiby*) 12654-7.

AUSTRIA. See under Colonial and Foreign Countries.

BANGOR, UNIVERSITY COLLEGE OF N. WALES.

Evidence received principally from (*Pennant*) 6480-6649; (*Winter*) 6650-6906.

- Aberystwyth, relations with (*Pennant*) 6591-4; (*Winter*) 6878-9.
- Analyses (*Winter*) 6892-4.
- Boundary between, and Aberystwyth, *see under* Aberystwyth.
- Board of Agriculture, relations with (*Winter*) 6653e.
- Governing body (*Pennant*) 6533-4, 6603-5; (*Winter*) 6690-5, 6697-702, 6752-8, 6895-8.
- History of the formation of the Agricultural Department (*Brooke-Hunt*) 15558-9; (*Pennant*) 6482a, 6485-6a, 6487a, 6558-61; (*Winter*) 6653a.
- Earliest recipient of a grant from Board of Agriculture (*Brooke-Hunt*) 15558.
- Relations with neighbouring counties (*Pennant*, 6487a, 6488-9, 6491-2, 6521-3, 6568-75, 6616-9; (*Winter*) 6653f, 6696, 6703-7, 6752-8.
- Attitude of Agriculturists towards, *see that title*.
- Courses of Instruction (*Winter*) 6653g, 6747-51.
- Elementary school teachers, *see that title*.
- Dairy Schools at Llewenni, Sylfaen and Bangor (*Winter*) 6653c, 6654-9.
- History of the establishment of the Llewenni School (*Pennant*) 6482b, 6483-4, 6487, 6553-7.
- Relations with the College and County Councils, (*Pennant*) 6490.
- Students, number of (*Winter*) 6653k.
- Type of (*Pennant*) 6505.
- Success of students at R.A.S.E. Show, 1893 (*Pennant*) 6495a.
- Those at Sylfaen and Bangor have been abandoned (*Winter*) 6686-9.

External Work :

- Experiments (*Pennant*) 6385-7, 6493a, 6507-9; (*Winter*) 6659d.
- Distribution of reports of the (*Winter*) 6800-3.
- Effect of, on system of farming in the neighbourhood (*Winter*) 6659e.
- Results of, published as leaflets (*Pennant*) 6507.
- Lectures (*Pennant*) 6493-4, 6541; (*Winter*) 6653d, 6659a, 6876-7.
- Circulation of literature in connection with (*Winter*) 6659c.
- Effect of, on co-operation (*Winter*) 6659b, 6810-4.
- Farm (*Pennant*) 6497-9, 6512-5, 6538-40, 6563-7, 6588-90; (*Winter*) 6659h, i, 6738-46, 6837-40, 6852-8, 6887-8.
- Finance :
- Financial arrangements (*Winter*) 6698-707.
- Inadequacy of present grant from Board of Agriculture and Fisheries (*Winter*) 6661b-6663a.
- Sources of income (*Pennant*) 6519-20, 6606-11.
- Receipts from private sources (*Pennant*) 6558-61.
- As to the possibility of further (*Winter*) 6713-7.
- Work curtailed through lack of funds (*Winter*) 6659g.

Bangor, University College of N. Wales—cont.

Forestry Department (*Winter*) 6653g, 6659k, 6660-1a, 6729-31, 6736-7, 6880-3.

Requires development (*Winter*) 6663c, 6735.

Scholarships, tenable at (*Pennant*) 6576-81; (*Winter*) 6776a-80, 6868-71.

Staff (*Winter*) 6860, 6863-4.

Difficult to retain services of members of the (*Pennant*) 6494, 6516, 6524-9.

Inadequately paid (*Pennant*) 6495.

Students :

Fees (*Winter*) 6723.

Total cost to student (*Winter*) 6724.

Number of (*Winter*) 6653h, i, 6821, 6861-2, 6865-8.

Previous education of, *see that title*.

Residential arrangements (*Pennant*) 6500-3.

Type of student and their after-careers (*Winter*) 6725-8, 6781-8, 6822-33.

BARKER, Mr. B. T. P., M.A. *Director of the National Fruit and Cider Institute, Long Ashton, near Bristol.* (Qualifications of Witness, *see* 8407-8.) Evidence, 8405-8577.

BARNARD CASTLE. *See under* North-Eastern County School.

BASING, HAMPSHIRE FARM SCHOOL AT.

Evidence received principally from (D. T. Cowan) 5085-5293.

Board of Agriculture, relations with (D. T. Cowan) 5215-6.

Buildings (D. T. Cowan) 5088a, 5088d.

Directions in which work could be extended (D. T. Cowan) 5279-82, 5287-8.

History and aim of the School (D. T. Cowan) 5086-8, 5179, 5281.

Not situated on soil that is quite typical of the county (D. T. Cowan) 5088b, 5251-2.

Scheme of instruction, linking up elementary schools in Hampshire with University College, Reading, through evening continuation school and Basing Farm School (D. T. Cowan) 5271-8.

School could, if required, act for a group of counties (D. T. Cowan) 5247-54.

To a student who is going to be a farmer Basing gives a more valuable education than a university college (*Simmons*) 8593.

Value of instruction given (*Percival*) 4137, 4141.

Attitude of Agriculturists towards, *see that title*.

Courses of Instruction (D. T. Cowan) 5090, 5105-8, 5110-25, 5150, 5152-7, 5184-5, 5258-61, 5289-90.

Elementary school teachers, *see that title*.

Just what is wanted (*Simmons*) 8723, 8726.

Mainly practical (D. T. Cowan) 5174-81.

Time spent by students in doing manual labour could be better employed (*Swanwick*) 7629, 7698-703.

External Work (D. T. Cowan) 5126-7.

Dairy instruction (D. T. Cowan) 5209-12.

Exhibits at local shows (D. T. Cowan) 5140-3, 5187-10, 5293.

Farriery school (D. T. Cowan) 5171-3, 5205-8, 5213-8, 5219-24.

Lectures (D. T. Cowan) 5165-8, 5291-2.

Farm (D. T. Cowan) 5087, 5088c, 5144-51.

Finance :

Financial position (D. T. Cowan) 5100-4, 5194, 5225-38.

Received grant from Board of Education (D. T. Cowan) 5207, 5239-44.

Work has been hampered through want of funds (D. T. Cowan) 5151, 5165-70, 5192-4, 5261.

Reading University College :

Dairy students do not go on to (D. T. Cowan) 5161-4.

Instruction given at Basing is most useful for those students who go on to (*Sutton*) 4021-3.

Relations between Reading and Basing (*Childs*) 3851a, 3851c, 3852, 3985-7; (D. T. Cowan) 5109; (*Percival*) 4141.

Scholarships from Basing tenable at (D. T. Cowan) 5109a, 5195-201.

Scholarships tenable at (D. T. Cowan) 5263-5.

Staff (D. T. Cowan) 5092-4, 5126-7, 5176-9, 5186, 5261.

Basing, Hampshire Farm School at—cont.**Students :**

Fees (D. T. Cowan) 5095-6.

Higher, charged to students from outside the county (D. T. Cowan) 5096.

Number of (D. T. Cowan) 5160.

Residential accommodation for (D. T. Cowan) 5088d, 5089, 5097-9, 5194, 5248-50.

Type of student and their after-careers (D. T. Cowan) 5090a, 5091, 5129, 5137a, 5138-9, 5159-60, 5182-3, 5201a, 5202-4, 5262-5; (*Percival*) 4137-8.

BATH AND WEST AND SOUTHERN COUNTIES SOCIETY.

Evidence received from (Acland) 2617-2926, *representing the Society.*

Attitude of agriculturists towards, *see that title*.

Dairy and farriery schools, started by the (Acland) 2628-38.

Effect of instruction provided by the (Acland) 2762-2771, 2776-80, 2786.

Experiments (Acland) 2618-22, 2895-6.

Publications of the (Acland) 2623-7, 2892-4.

BEAMINSTER GRAMMAR SCHOOL. *See under* Dorset.

BEAVEN, Mr. E. S., of Warminster, Wilts. (Qualifications of witness, *see* 14129-35, 14163-4, 14167-8, 14219-20.)

Evidence, 14129-14220.

BEDFORDSHIRE. *See under* Ridgmont Agricultural Institute.

BEE-KEEPING. *See under* British Bee-keepers' Association and Subjects of Instruction.

BELGIUM. *See under* Colonial and Foreign Countries.

BENSON, Mr. MILES. *Manager and Chief Instructor of the British Dairy Institute, Reading.* (Qualifications of witness, *see* 2555-60.)

Evidence, 2491-2616.

BERKELEY HUNT AGRICULTURAL SOCIETY. *See under* Gloucestershire.

BERKSHIRE.

Evidence received principally from (Dunn) 11915-12013.

Classes were formerly held in:

Dairying (Dunn) 11964-5.

Farriery (Dunn) 11965-7; (*Wheatley*) 12916-24, 12933, 12937-8.

Instruction in farriery should be continued (*Wheatley*) 12922, 12928.

Scholarships for agriculture were awarded (Dunn) 11969-77.

Education Committee (Dunn) 11939, 11945-50.

Finance :

Council anxious to promote agricultural interest, but are unable to do so owing to lack of funds and heavy expenditure on secondary schools (Dunn) 11917-31, 11951-2, 11955-63, 11979-80, 11984-95, 12007.

Expenditure on agricultural education has been decreasing year by year (Dunn) 11919-20, 11960-2, 11977-8.

Present provision of agricultural education is insufficient, but could not be increased from local funds (Dunn) 11932-8.

Would welcome any increase in the amount available for agriculture (Dunn) 11963, 11968.

Reading University College, relations with (Dunn) 11939-44, 11977, 11987-90.

BICKERSTETH, Mr. JOHN. *Clerk to the County Council for the East Riding of Yorkshire, and one of the Joint Clerks to the Yorkshire Council for Agricultural Education.*

Evidence, 2927-2998, 3080-3300.

"BIGOD'S HALL," COUNTESS OF WARWICK'S SCHOOL AT DUNMOW.

Evidence received principally from (Hacking) 6907-6996.

- Aim of instruction (*Hacking*) 6908, 6910, 6939b-d.
- Analyses (*Hacking*) 6937a, 6938-9.
- Attitude of agriculturists towards, *see that title*.
- Courses of instruction, with information as to how the various subjects are treated (*Hacking*) 6920-8, 6930-7, 6939a; (*Nicholas*) 1050-6.
- Experimental plots (*Hacking*) 6931b.
- Financial position and prospects (*Hacking*) 6908-10, 6910a, 6916-8, 6945-6, 6956-63, 6981, 6986-7.
- Desirable that the school should be placed on a more permanent basis (*Hacking*) 6957-78.
- Essex County Council, grants from (*Nicholas*) 1226-7.
- Relations with Board of Education (*Hacking*) 6910a, 6945, 6949-55, 6964.
- Scholarships tenable at (*Hacking*) 6915.
- Need of more (*Hacking*) 6939f.
- Staff (*Hacking*) 6929, 6933-4.
- Students:
 - Fees (*Hacking*) 6919.
 - Number of (*Hacking*) 6940.
 - Residential accommodation for (*Hacking*) 6912-4.
 - Type of student and their after-careers (*Hacking*) 6910b, 6911, 6939e, 6941-4, 6947-9; (*Nicholas*) 1052-6.

BIOLOGY. *See under* Subjects of Instruction.

BIRMINGHAM, UNIVERSITY OF.

Evidence received principally from (Collinge) 5034-5084; (Lodge) 5472-5541.

- Advisory Board of Agriculture (*Collinge*) 5035c, 5038, 5077-9; (*Lodge*) 5517-9, 5473c.
- Counties represented on (*Collinge*) 5077-9.
- Future development as regards agriculture (*Collinge*) 5081-4, 5035f, 5036, 5049, 5062-3; (*Lodge*) 5473.
- Financial prospects (*Lodge*) 5484-91.
- Money is the vital question (*Lodge*) 5473d.
- Schemes for formation of a department of agriculture and their probable cost (*Lodge*) 5473a, 5474-5, 5493-5502, 5508-11, 5520-4.
- Length of residence required for a degree (*Lodge*) 5125-30.
- Department of Economic Zoology:**
 - Attitude of agriculturists towards, *see that title*.
 - Financial position (*Collinge*) 5036a, 5037-9, 5047, 5055-60, 5075-84; (*Lodge*) 5473b.
 - History of the formation of (*Collinge*) 5035.
 - Relations with neighbouring counties (*Wheeler*) 6465. (*See also* Advisory Board above).
 - Gloucester, work in, has been dropped (*Collinge*) 5031.
 - Scope of work, at present, conducted (*Collinge*) 5035d-f, 5040-4, 5053-4.
 - Number of inquiries received and reports distributed (*Collinge*) 5035b, 5048.

BLACKSHAW, Mr. J. F., F.C.S., A.S.I. *Principal of the Midland Agricultural and Dairy College, King-ston, Derby.* (Qualifications of witness, *see* 1815-7.)

Evidence, 1062-1833.

BOARD OF AGRICULTURE AND FISHERIES.

Evidence received from (Rogers) 15116-15436; (Brooke-Hunt) 15515-15690, representing the Board.

For information as to the control exercised by the Board of Agriculture over agricultural education, see under Organisation, and as to the Grants given for agricultural education see under Expenditure.

- History of the formation of the Agricultural Department of Privy Council, subsequently the Board of Agriculture (*Craigie*) 13176b, 13177b.
- Veterinary staff of, might work in closer contact with the colleges (*Winter*) 6906.
- Whether the Board should have a staff of experts to deal with outbreaks of animal and other diseases (*Winter*) 6899-906.

Educational Branch:

- Inspection work (*Brooke-Hunt*) 15573-7.
- Larger staff will have to be employed (*Craigie*) 13200-3.
- Staff and work of the (*Brooke-Hunt*) 15519-26, 15529, 15531, 15534-5, 15537-41.

Board of Agriculture and Fisheries—cont.**Honorary Agricultural Correspondents:**

- Duties of the, and assistance rendered to the Board (*Rogers*) 15132-51.
- Might assist in spreading a knowledge of the publications of the Board and the assistance available for agriculturists (*Brockholes*) 13757-13758; (*Dugdale*) 4969-72, 5027-33; (*Mill*) 6347-8, 6396-8; (*Simmons*) 8732-8.
- Type of man employed as (*Swanwick*) 7666-8, 7742-5, 7749.
- Value of the, to agriculturists and others (*Acland*) 2676, 2711, 2774-5, 2787-8, 2804-7; (*Amos*) 947; (*Carrick*) 500-2; (*Drewitt*) 12168-9; (*Eady*) 9381-3; (*Nicholas*) 1223-5; (*Péet*) 12507-11; (*Peter*) 9881-2; (*Wheeler*) 6474-9; (*Winter*) 6804-5; (*Wood*) 233-6, 238.

Intelligence Branch:

- Agricultural colleges, information and assistance received from (*Rogers*) 15152-62, 15277-80.
- Exhibits at agricultural shows (*Rogers*) 15324-31, 15347-8, *see also* (*Acland*) 2744-5, 2789-90, 2792-3.
- General correspondence, information obtained by means of (*Rogers*) 15163-5.
- Information disseminated by means of the Press and in other ways (*Rogers*) 15202-7, 15213.
- Insect and fungoid pests, &c., information and advice given as regards (*Rogers*) 15130-1.
- Library of the Board may be consulted by agriculturists (*Rogers*) 15154-6, 15280.
- Milk-testing scheme (*Rogers*) 15267-9, 15271-5, 15346, 15349-53.
- Opposition to (*Rogers*) 15270, *see also under* Analyses.
- Use made of, by farmers (*Foulkes*) 5874-7; *see also under the various institutions and counties, Analyses.*
- Staff and scope of the work of (*Rogers*) 15117-29, 15258, 15307-20, 15358-62.

Publications:

- Annual reports (*Brooke-Hunt*) 15580-1; (*Rogers*) 15196-201, 15215-8, 15227, 15231-2, 15239, 15246-7, 15265-6, 15294-6.
- Distribution of (*Acland*) 2804-5, 2807, 2810-24, 2923-6; (*Brockholes*) 13712-3; (*Dugdale*) 4941-3, 4965-9; (*T. H. Middleton*) 15475-7; (*Péet*) 12462-6; (*Simmons*) 8736-8; (*Turnor*) 14435-8.
- Journal (*Rogers*) 15166-80, 15261.
- Leaflets (*Acland*) 2924-6; (*Drewitt*) 12156-60; (*Eve*) 13005-6; (*Gilchrist*) 714-7; (*Lawrence*) 7399-401; (*Peter*) 9880, 9883-9; (*Reid*) 14627; (*Rogers*) 15182-95, 15215, 15223-5, 15233-6, 15259-61, 15265-6, 15297; (*W. P. Wright*) 10190-2.
- Market Returns (*Eady*) 9384-91, 9437-41; (*Rogers*) 15354-7; (*Swanwick*) 7642, 7745-8.
- Other publications of the Board (*Rogers*) 15262-4.
- Sent to local authorities (*Brooke-Hunt*) 15580-1; (*Rogers*) 15207-14, 15217, 15219-23, 15226-30, 15236-9.
- Whether the, are made to pay (*Rogers*) 15227, 15231, 15240-5, 15248-57.

BOARD OF EDUCATION.

Evidence received from (Ogilvie) 15690-16133, representing the Board.

- Attitude of, towards agricultural education (*Phipps*) 9118, 9189-92.
- Do not put pressure upon local authorities but hold out considerable inducements and endeavour to persuade them (*Ogilvie*) 15879-93.
- Examination in agriculture (Subject XXIV.) (*Ogilvie*) 15958-80, 16107-9.
- For a long period the, and the Science and Art Department have made efforts with a view to benefitting agriculture (*Ogilvie*) 15724-5, 15872-8, 16048-54; *refer also to* (*Craigie*) 13176a.
- Have recently done a great deal to assist agricultural education (*J. A. Smith*) 14532.
- Machinery used to invite the co-operation of persons interested in any branch of education (*Ogilvie*) 15728-9, 15145-8.
- Powers of the Boards of Agriculture and Education as regards agricultural education, *see under* Organisation.
- Staff of inspectors (*Ogilvie*) 15730-1, 15743-4.

Board of Education—cont.

- Steps that would be taken by, to ensure that a County Council were not neglecting agricultural education (*Ogilvie*) 15772-80.
- "Suggestions on Rural Education," by Mr. T. S. Dymond (*Ogilvie*) 15690e, 15918, 16117-9
- Usually communicate with the local authority but when necessary get in touch with local managers (*Ogilvie*) 15948-57.
- Whether the, could assist the Royal Veterinary College (*Ogilvie*) 15928-30, 15943-5.
- Work of, in connection with the Treasury grants to universities and university colleges (*Ogilvie*) 15734-15739, 16110-3.

Agricultural Work of County Councils :

- Aid given to local authorities who organise :
- Classes meeting two or three times weekly in day or evening throughout the session (*Ogilvie*) 15690l, 15695c-f.
 - Short continuous courses of work, e.g., travelling dairy schools and winter schools for young farmers (*Ogilvie*) 15690k, 15695c-f, 15826-40.
 - Arrangements made to afford aid and encouragement for the establishment of facilities for instruction of students able to devote a portion of their time to study (*Ogilvie*) 15690i.

See also under Grants below.

Elementary Schools :

- Devoting much attention to the training of teachers engaged in rural areas (*Ogilvie*) 15690o-p, 15695a-b, 15707, 15797-806.
 - Do not encourage elementary school teachers to attend classes in nature study (*Winter*) 6659g, 6684-5.
 - Recognise the need for elasticity in curriculum of elementary schools (*Ogilvie*) 15690d.
 - Work of, as regards rural elementary schools (*Ogilvie*) 15690c-d.
- Refer also to Previous Education—Elementary, and to Elementary School Teachers.

Grants :

- Endeavouring to replace system of grants for separate subjects by a system based on progressive courses of study (*Ogilvie*) 15695c.
- Grants are calculated upon a very elastic system (*Ogilvie*) 15690n, 15695f.
- Grants are intended to bear a fair proportion to the total expense incurred, alike in urban and rural areas (*Ogilvie*) 15983-9.
- Grants to day technical classes (*Ogilvie*) 15696a, 16102-6.
- Grants to institutions providing technical instruction in agriculture (*Ogilvie*) 15724-7.
- Grants to technical institutions (*Ogilvie*) 15696b, 16102-6.
- Make it a rule that teacher's salary does not depend directly on the amount of the Board's grant (*Ogilvie*) 15981-2.
- Offer, with the authority of the Treasury, to pay grants upon certain principles set forth in the regulations (*Ogilvie*) 16018-24.
- Possible that agricultural institutions may seek grants from Board of Education because Board of Agriculture have no funds (*Ogilvie*) 15766-15771.
- Recognise the work of an institution or area as a whole (block grant system) (*Ogilvie*) 15695c-f, 15946-51, 15983-9.
- Advantage of such a system (*Ogilvie*) 15847-53.

Higher Elementary or Secondary Schools :

- Desire to cultivate the assimilation of the curriculum of secondary schools to the requirements of the pupils (*Ogilvie*) 15690h.
 - Provision made for higher elementary schools (*Ogilvie*) 15690c, 15841-6, 16058-9.
 - Secondary school regulations (*Ogilvie*) 15690g.
- Refer also to Previous Education—Secondary.

Technical Classes or Institutions :

- Function of a technical institution (*Ogilvie*) 15696b.
 - Supervision exercised by, over institutions providing technical instruction (*Ogilvie*) 15723.
- See also under Grants above.

BRADLEY, Miss EDITH. *Late Warden of the Lady Warwick Hostel, Reading, and Studley Horticultural College, Warwickshire.* (Qualifications of witness, see 8747-50, 8752, 8783-4.)

Evidence, 8745-8854.

BREDONS NORTON, SCHOOL OF GARDENING AT.

Evidence received principally from (Crooke) 4691-4867.

- Aim of, and courses of instruction (Crooke) 4694c, 4697-702, 4717-20, 4741-4, 4754-62, 4768-70, 4797-800, 4827-33, 4850-4.
- Financial position (Crooke) 4695-6, 4708-13, 4822-4826, 4839-42.

Students :

- Fees (Crooke) 4706.
- Number of (Crooke) 4703.
- Residential accommodation for (Crooke) 4704-5.
- Type of student and their previous education (Crooke) 4714-6, 4787-92, 4862-7.

Women's International Agricultural Club in connection with the School of Gardening :

- Aim of, and number and type of members (Crooke) 4721-43, 4843-9, 4854-61.

BRISTOL UNIVERSITY COLLEGE.

Evidence received principally from (Morgan) 5929-6010.

- Is not the most suitable centre for county of Gloucester (*Swanwick*) 7761-2.
- National Fruit and Cider Institute, relations with (*Barker*) 8438-9, 8527-8 ; (*Morgan*) 5932d, 5981.
- Projected lines of development (*Morgan*) 5932a, 5932c-d, 5933-9, 5940-1, 5945-51, 5963-6, 5984, 5993-6004.
- Financial prospects (*Morgan*) 5959-60, 5985-7, 6005-6.
- Royal Agricultural College, Cirencester, relations between (*Morgan*) 5940-1, 5945-7, 5950-1, 5961-3, 5982-3, 5988-95.
- Staff (*Morgan*) 5967-70, 5974-80.
- What the College is and what it hopes to become (*Morgan*) 5942-4, 5948.
- Work bearing on agriculture which has been carried out (*Morgan*) 5932, 5932b.

BRITISH BEE-KEEPERS' ASSOCIATION.

Evidence received from (Reid) 14583-14722 ; (T. W. Cowan) 14723-14838, representing the Association.

- Board of Agriculture, relations with (T. W. Cowan), 14726-30, 14738-42 ; (Reid) 14627.
 - County Associations (Reid) 14598-600.
 - County work can better be carried out through the (T. W. Cowan) 14782-3 ; (Reid) 14684, 14722.
 - In counties where there are no, the central body endeavour to carry on the work and start an association (T. W. Cowan) 14782-3 ; (Reid) 14597, 14620-2.
 - Relations between, and the central body (T. W. Cowan) 14757-8 ; (Reid) 14599.
 - For example of the work of a County Association, see under Surrey.
 - Encouragement given to co-operation (Reid) 14614-5.
 - Examinations of the (T. W. Cowan) 14731-6, 14609.
 - Experimental apiary at Swanley (T. W. Cowan) 14744-8.
 - Financial position (T. W. Cowan) 14604, 14752, 14757.
 - Income insufficient (T. W. Cowan) 14759-60 ; (Reid) 14620. (See also Suggests, &c., below.)
 - Publications of the (T. W. Cowan) 14737, 14834-8 ; (Reid) 14680.
 - Suggests that the State should assist bee-keeping through the Association (T. W. Cowan) 14759-14760, 14778-81, 14784-6 ; (Reid) 14626, 14671, 14689-90.
 - Great increase in the production of honey would result from the further diffusion of information (T. W. Cowan) 14786a-7.
 - Work in connection with shows, and personal assistance to bee-keepers (T. W. Cowan) 14750-1, 14783 ; (Reid) 14605-7, 14611, 14678-81.
- See also under Subjects of instruction, Bee-keeping.

BRITISH DAIRY FARMERS' ASSOCIATION. See under British Dairy Institute, Governing Body.

BRITISH DAIRY INSTITUTE, READING.

Evidence received principally from (Ashcroft) 2336-2490; (Benson) 2491-2616.

Board of Agriculture, relations with (Ashcroft) 2401-2; (Benson) 2573-4.

Building accommodation (Ashcroft) 2356-63, 2375-8, 2380-2.

Direction in which operations could be extended (Ashcroft) 2405, 2459.

Exhibits at Dairy Show (Benson) 2540-3.

Governing body (Ashcroft) 2366, 2383-96.

Instruction given has been of decided value to dairying industry (Ashcroft) 2398-400, 2410.

Courses of Instruction (Ashcroft) 2368-74, 2429-35, 2452, 2457; (Benson) 2492-5, 2498-500, 2502-16, 2569-74, 2594-603.

Examinations (Ashcroft) 2368-9; (Benson) 2536-2538.

Instruction could be made more complete if Institute kept cows and was connected with a creamery (Ashcroft) 2429-35, 2481-90.

Financial Position (Ashcroft) 2355, 2404, 2406, 2446-7. Cost of milk has increased as result of transfer from Aylesbury to Reading (Ashcroft) 2348.

Research Work (Benson) 2496-7, 2584-93, 2609-16.

Students :

Fees (Ashcroft) 2403, 2467-71.

And cost of residence (Ashcroft) 2420-4; (Benson) 2567-8.

Number of (Ashcroft) 2342, 2345, 2450-1; (Benson) 2532.

Residential accommodation for (Ashcroft) 2356-2363; (Benson) 2565-8.

Type of student and their after-careers (Ashcroft) 2349-50, 2353, 2364, 2485; (Benson) 2501, 2509, 2528-39, 2563-4.

University College, Reading, relations with (Ashcroft) 2346-8, 2351-2, 2355a, 2366, 2445-7, 2461-6, 2480, 2482-4; (Benson) 2495-7, 2511; (Childs) 3812e, 3813, 3827-9; (Sutton) 4103.

BROCKHOLES, Mr. W. FITZHERBERT. *Chairman of the Lancashire Farmers' Association and Member of the Lancashire County Council.* (Qualifications of witness, see 13661-4, 13681-3.)

Evidence, 13660-13827.

BROOKE-HUNT, Mr. A. E. *A Superintending Inspector of the Board of Agriculture and Fisheries and Secretary to the Committee.* (Qualifications of witness, see 15515-8, 15584.)

Evidence, 15515-15690.

BROWN, Mr. EDWARD, F.L.S. *Assistant Director of the Agricultural Department, and Lecturer in Poultry-Keeping at the University College, Reading.* (Qualifications of witness, see 6155b.)

Evidence, 6152-6291.

BURNE, Colonel S. T. H. *Chairman of the Board of Governors of the Harper-Adams Agricultural College, Newport, Salop.*

Evidence, 5542-5685.

CAMBRIDGE COUNTY SCHOOL FOR BOYS (T. H. Middleton) 15501-13; (Wood) 115-6, 226-32.

CAMBRIDGE, UNIVERSITY OF.

Evidence received principally from (Wood) 1-238; (Sapwell) 239-314; (T. H. Middleton) 15458-15514.

Analyses, no routine (Wood) 95.

Buildings, need of (T. H. Middleton) 15459g, 15460a; (Wood) 21, 24.

Governing body (Wood) 62-4, 137-8, 206-10.

History of foundation of the Agricultural Department (Wood) 1.

Influence exerted over neighbouring counties (Wood) 208-11.

Work done at, is thought highly of (Sapwell) 241a, 242, 254-6, 257-9, 291-3. (See also under Attitude of Agriculturists.)

Cambridge, University of—cont.

Attitude of Agriculturists towards, *see that title.*

Courses of Instruction (T. H. Middleton) 15458a, c, e; (Wood) 2-5, 31-2, 101, 108-113, 168-72, 175-6, 194.

Elementary school teachers, *see that title.*

Examinations (Wood) 75-8, 80-4, 102, 215-9.

External Work :

Experiments (T. H. Middleton) 15459e; (Wood) 34-41. (See also under Norfolk.)

Lectures (Sapwell) 241d, 243-4; (Wood) 45-6, 48, 96-9, 103, 182-4, 187.

Farm (T. H. Middleton) 15458d, 15459e; (Wood) 30-2, 92-4, 152.

Cost of (T. H. Middleton) 15459d.

Use made of, for demonstrating to farmers (T. H. Middleton) 15458f, 15459a; (Wood) 27a, 28, 160-1.

Finance :

Financial position (Wood) 122-31.

Require increased grant (Wood) 42.

Grounds for (Wood) 85, 87-9.

Sources of income (Wood) 24-5, 67, 199-202.

Research Work (Beaven) 14159-62; (Humphries) 13836, 13874; (Sapwell) 241d, 254-6; (Wood) 37-8, 161, 198, 203.

Scholarships tenable at (T. H. Middleton) 15458c; (Wood) 4-6, 10-15, 195-7, 224.

Staff (Wood) 56.

Inadequate (Wood) 22-4.

Inadequately paid (Wood) 86.

Students :

Fees and cost of instruction (Wood) 141-51.

As to question of raising (Wood) 70-3.

Number of (Wood) 7-9.

Previous education of, *see that title.*

Type of student and their after-careers (T. H. Middleton) 15458b-d; (Sapwell) 297-306; (Somerville) 15100; (Wood) 16-20, 57-8, 60-1, 100, 105-7, 114, 162-7, 220-3.

CAMPBELL, Professor J. R., B.Sc. *Assistant Secretary in respect of Agriculture under the Department of Agriculture and Technical Instruction for Ireland.*

Evidence, 11135-11414.

CANADA. *See under Colonial and Foreign Countries.*

CARRICK, Mr. T. *Alderman of the Northumberland County Council, and a Member of the Council and Agricultural Committee of the Armstrong College, Newcastle-upon-Tyne.*

Evidence, 315-516.

CAVE, Mr. T. W., F.R.C.V.S. *Professor of Veterinary Science at the South-Eastern Agricultural College, Wye.* (Qualifications of witness, see 9485-9, 9503.)

Evidence, 9485-9584.

CHELMSFORD LABORATORIES. *See Essex County Technical Laboratories, Chelmsford.*

CHEMISTRY. *See under Subjects of Instruction.*

CHESHIRE.

Elementary school teachers, provision of instruction for, *see that title.*

History of the commencement of agricultural education in, before the County Council took up the work (McCracken) 9209-18.

School gardens (Ward) 4614-21.

System of inspection (Young) 1410-4.

See also Holmes Chapel, College of Agriculture and Horticulture, and Worleston Dairy Institute.

CHILDS, Mr. W. M., M.A. *Principal of the University College, Reading.*

Evidence, 3811-3922, 3929-4014.

CIDER INSTITUTE. *See National Fruit and Cider Institute.*

CIDER-MAKING. *See under* National Fruit and Cider Institute and Subjects of Instruction.

CIRENCESTER COLLEGE. *See* Royal Agricultural College, Cirencester.

CIRENCESTER GRAMMAR SCHOOL. *See under* Gloucestershire, Rural Science Class at.

COCKBURN, The Hon. Sir JOHN A., K.C.M.G. *Late Minister of Agriculture, South Australia.*

Evidence, 10522-10598.

COCKLE PARK FARM. *See under* Armstrong College.

COLLEGE OF AGRICULTURE AND HORTICULTURE, HOLMES CHAPEL. *See under* Holmes Chapel.

COLLEGE POULTRY FARM, THEALE. *See under* Reading University College.

COLLINGE, Mr. WALTER E., M.Sc. *Head of the Department of Economic Zoology, University of Birmingham.*

Evidence, 5034-5084.

COLONIAL AND FOREIGN COUNTRIES, AGRICULTURAL EDUCATION IN.

Agricultural societies on the Continent are actively engaged in the work of agricultural education (*T. H. Middleton*) 15442c.

Almost impossible to ascertain amount spent on agricultural education in foreign countries (*Rogers*) 15381-8.

Assistance given in, to instruction in bee-keeping (*T. W. Cowan*) 14760-3.

At many institutions abroad no fees are charged to students coming from the country or state in which the institution is situated (*Brown*) 6165c.

Poultry-keeping, instruction in, abroad (*Brown*) 6165b.

Suggests the establishment of a Readership in Tropical Agriculture at universities in this country (*H. S. Lawrence*) 16187-9, 16215-8, 16227-9.

Systems practised abroad are scarcely comparable to that existing in this country (*Rogers*) 15249, 15367-71.

Veterinary education, assistance given by colonial and foreign governments to (*McFadyean*) 9703, 9712.

Australia :

Evidence received principally from (Cockburn) 10522-10598.

Assistance given by agricultural colleges and the Government Department to actual farmers (Cockburn) 10542, 10544-6.

Early steps taken in every grade of education to teach agriculture (Cockburn) 10526-8.

Farmers are mostly working farmers (Cockburn) 10576-8.

Agricultural Colleges :

Courses of instruction (Cockburn) 10528c, 10529, 10534-5, 10540-1, 10555, 10582-4.

Financial assistance received from the Government (Cockburn) 10538-9, 10549-10554.

Students :

Fees (Cockburn) 10531.

Type of student and their after-careers (Cockburn) 10532-3, 10536-7, 10580-1, 10590-2.

Undoubtedly popular (Cockburn) 10589.

Elementary Schools :

Manual training in (Cockburn) 10528a.

Training of teachers (Cockburn) 10548.

Experimental Farms (Cockburn) 10585-8.

Scholarships (Cockburn) 10529a, 10530-1.

Secondary and Technical Schools (Cockburn) 10528b, 10563-6.

Austria (*Rogers*) 15407-9, 15430.

Colonial and Foreign Countries, Agricultural Education in —cont.

Belgium, agricultural education in: with information as to how far the conditions are comparable with those in this country (*Rogers*) 15368-96, 15426-9.

Success of co-operation and small-holding movement (*Turnor*) 14260-3.

Canada (*Craigie*) 13221-5; (*Gilchrist*) 660-2.

Farmers' institutes (*Brown*) 6171b.

Denmark (*Rogers*) 15420-1.

Danes practise that the first step is that the ordinary education of a boy who is to be trained in agriculture should be thorough (*Craigie*) 13230.

Excellent practical results obtained from experiments conducted by the Royal Agricultural Society of Denmark (*Beaven*) 14151-5.

France (*Rogers*) 15377-8, 15382, 15390-3.

Agricultural education in, and comparison with the system in England (*Craigie*) 13205-10, 13234-59.

How far the conditions in, are comparable with those in this country (*Rogers*) 15368-71, 15377-96.

Use made of experimental plots by small farmers in (*Hall*) 1531.

Germany (*T. H. Middleton*) 15442d, 15443-8, 15480-1; (*Rogers*) 15397-403.

Agricultural Institute at Dahlem (*T. H. Middleton*) 15449f.

Large number of qualified teachers available (*T. H. Middleton*) 15446-8.

Research work conducted in (*Beaven*) 14143-50.

Students, type of (*T. H. Middleton*) 15450.

Veterinary education in (*T. H. Middleton*) 15464-7.

Prussia (*T. H. Middleton*) 15442b, 15448.

Saxony (*T. H. Middleton*), 15442a, 15449g.

Experiment stations in (*T. H. Middleton*) 15448a.

Holland :

Description of Dutch winter school (*Swanwick*) 7612-20, 7622-5, 7646-53.

Market gardening schools (*Bradley*) 8768-9.

Hungary :

Much impressed with the good results from system of agricultural education (*Craigie*) 13230-3.

India :

Evidence received principally from (*H. S. Lawrence*) 16134-16272; (*Moreland*) 16273-16306.

Agricultural and live stock shows (*H. S. Lawrence*) 16262-5.

Attitude of the Government of India to agricultural education (*H. S. Lawrence*) 16135-8, 16227-9; (*T. H. Middleton*) 15451-8; (*Moreland*) 16291-2.

Highly desirable that European experts should be given opportunity, by means of "study-leave," for keeping knowledge up-to-date (*Mead*) 16272.

In all provinces of India agricultural education is under the Department of Agriculture (*H. S. Lawrence*) 16266-7; (*Moreland*) 16301-6.

Inspector-General of Agriculture for India (*H. S. Lawrence*) 16204-5.

Local agricultural association (*H. S. Lawrence* and *Mead*) 16253-4. Research Institute of Pusa (*H. S. Lawrence*) 16206, 16252; (*T. H. Middleton*) 15451, 15454.

School gardens and school shows (*H. S. Lawrence*) 16211-2.

Work of agricultural departments in United Kingdom in supplying teachers for India (*H. S. Lawrence*) 16198-203, 16225-6; (*Mead*) 16271-16272.

Bombay.

Co-operative movement and agricultural banks (*H. S. Lawrence* and *Mead*) 16166-72, 16268-70.

Elementary school teachers (*H. S. Lawrence*) 16213.

Expenditure of Department of Agriculture (*H. S. Lawrence*) 16135-8.

Experimental farms (*H. S. Lawrence*) 16149-65, 16205-9, 16246-51.

Colonial and Foreign Countries, Agricultural Education in—*cont.*India—*cont.*Bombay—*cont.*

- Itinerant advisers (*H. S. Lawrence*) 16210-2.
 Poona College (*H. S. Lawrence*) 16139, 16142, 16144, 16174-6, 16220-4, 16233-4.
 Attended by members of the Indian Civil Service (*H. S. Lawrence*) 16177-82.
 Staff (*H. S. Lawrence*) 16140-1, 16198-203.
 Students (*H. S. Lawrence*) 16143-9, 16190-16196, 16230-3, 16245.

United Provinces of Agra and Oudh:

- Cawnpore College (*Moreland*) 16295-9.
 Students (*Moreland*) 16288-90.
 Co-operative credit societies (*Moreland*) 16276-16287, 16293-4.
 Duties of the Director of Agriculture (*Moreland*) 16274-5.

Italy (*Turnor*) 14259.

- Instruction for soldiers (*Rogers*) 15411-5.
 Suggests that a similar system might be adopted in this country (*Reid*) 14637-55, 14695-700.
 Perugia, description of the demonstration farm at (*Turnor*) 14325-6, *see also* 14310-24.
 Success of lectures after the farmers had been interested in the work of the colleges (*Turnor*) 14255.

New Zealand:

- Evidence received principally from (*Hogben*) 14040-14128.

Department of Agriculture:

- Does not deal with purely educational matters (*Hogben*) 14047-50, 14128.
 Experimental farms (*Hogben*) 14048, 14077, 14094-9, 14125-8.

Education Department:

- Agricultural College (*Hogben*) 14074-6, 14082, 14091-3, 14099, 14114-7.
 Attitude of farmers towards agricultural education (*Hogben*) 14110-4.
 Dairy college of university rank about to be established (*Hogben*) 14100-2.
 Deals with every grade of education (*Hogben*) 14041, 14046, 14049.
 Education is mostly free (*Hogben*) 14056, 14077-9, 14098.
 Ordinary education of the agriculturists (*Hogben*) 14080-3.
 Primary schools:
 Elementary practical agriculture (*Hogben*) 14053-60, 14084-90, 14107-9, 14119.
 Nature study (*Hogben*) 14051-3, 14105-6.
 Secondary schools (*Hogben*) 14056, 14083, 14114, 14120.
 State encourages, by means of grants, agricultural education from elementary school up to the university (*Hogben*) 14041-4.
 Training of teachers (*Hogben*) 14061-75, 14103-4.

United States (*Craigie*) 13213-20, 13226; (*T. H. Middleton*) 15448b.

- Agricultural industry differs very widely from that in this country (*T. H. Middleton*) 15514.

Almost every State possesses:

- (a) Experimental Station (*T. H. Middleton*) 15448d, f, 15449a, 15471-2, 15504-5, 15514.
 (b) Land Grant College (*T. H. Middleton*) 15448d, 15449e.

Assistance given to educational and experimental work (*Brown*) 6188-92, 6205-11, 6253.

Association of teachers and others associated with educational and experimental work (*T. H. Middleton*) 15449b.

Bee-keeping in (*T. W. Cowan*) 14768-70.

Colleges recognise that the whole subject "agriculture" is too wide for one man (*T. H. Middleton*) 15448e.

Department of Agriculture, Washington (*T. H. Middleton*) 15448c, 15449d, 15468-70.

Distribution of publications (*T. W. Cowan*) 14770-7.

Farmers' institutes (*Brown*) 6174b; (*T. H. Middleton*) 15498-501.

Importance attached to biology in (*Collinge*) 5069a, 5070-3.

Research work (*Brown*) 6166a, 6167-71a; (*Reid*) 14630-7.

Colonial and Foreign Countries, Agricultural Education in—*cont.*United States—*cont.*

Students:

- Fees (*Brown*) 6165c, 6212-4, 6233.
 Provision is made whereby poor students are able to obtain employment in order to pay for board and lodgings (*Brown*) 6165d, 6166, 6234-5.

West Indies (*Hamel-Smith*) 8966-72, 8978-9.

COMPANY OF FARRIERS, *see* Farriers, Worshipful Company of.

CONSULTATIVE COMMITTEE OF THE BOARD OF AGRICULTURE. *See under* Organisation.

CONTINUATION CLASSES. *See under* Previous Education.

CO-OPERATION, AGRICULTURAL.

Co-operative societies are apt to get into the hands of managers who require to be well paid (*Tinniswood*) 7120-1.

Cumberland, co-operative societies and creameries in (*Smith-Hill*) 7501-4; (*Tinniswood*) 7120, 7122-4, 7168-71.

Effect of, on demand for and appreciation of agricultural education (*Brockholes*) 13814-7; (*Carrick*) 504-6; (*Gilchrist*) 607-10.

If small holdings are to succeed, something must be done to educate holders in co-operative methods (*McCracken*) 9278-9.

Importance of (*Bradley*) 8811-6.

Influence of education on co-operation (*Davies*) 8282; (*Tinniswood*) 7121.

Question as to whether the State should subsidise

co-operation (*Dugdale*) 4991-4; (*Winter*) 6815-20. Should be taught in every grade of school, especially in those for women (*Bradley*) 8769-72, 8782.

South Wales, co-operation in (*Davies*) 8280-2, 8315-7, 8391.

Success of the small holdings movement depends on (*W. P. Wright*) 10268-70.

Suggests that county education officials should be enabled to assist in developing co-operation (*Druce*) 3579-92.

Suggests that in connection with elementary school gardens, the principles of co-operation might be taught (*Bradley*) 8769-72.

Women are not in favour of (*Bradley*) 8769.

COPE, Mr. THOS. Chairman of the Leicestershire Education Committee and of the Governing Body of the Midland Agricultural and Dairy Institute, Kingston.

Evidence, 1640-1661.

COUNTESS OF WARWICK'S SECONDARY AND AGRICULTURAL SCHOOL, Dunmow, Essex.

See "Bigod's Hall."

COUNTY COUNCILS' ASSOCIATION.

Evidence received from (*Turnor*) 14221-14485; (*Hobhouse*) 14839-15041, representing the Association.

The Association are not satisfied with the agricultural education work of the County Councils (*Turnor*) 14355-9, but *see also* (*Hobhouse*) 15039-41.

COUNTY COUNCILS, WORK OF THE.

For information as to the work of any particular county *see under that county*; as to County Council Finance, generally, *see under Expenditure*; and as to organisation, generally, *see Organisation*.

COWAN, Mr. D. T. Director of Education for the Hants County Council.

Evidence, 5085-5293.

COWAN, Mr. T. W., F.L.S. Chairman of the British Bee-Keepers' Association. (Qualifications of witness, *see* 14680, 14718, 14724-5, 14800-2.)

Evidence, 14723-14838.

CRAIGIE, Major P. G., C.B. Recently Assistant-Secretary to the Board of Agriculture and Fisheries.

Evidence, 13175-13259.

CROOKE, Miss M. *Principal of the School of Gardening, Bredons Norton, near Tewkesbury.*
Evidence, 4691-4867.

CUMBERLAND. *See under* Newton Rigg, Cumberland and Westmorland Farm School.

DAIRYING. *See under* Subjects of Instruction.

DAUNTSEY AGRICULTURAL SCHOOL, WEST LAVINGTON.

Evidence received principally from (Solomon) 11415-11553.

Boards of Agriculture and Education, connection with (Solomon) 11421, 11423-31, 11434-7, 11450, 11456, 11524.

Capable of doing very valuable work (*Brooke-Hunt*) 15664.

Changed from its original purpose so as to obtain grant from Board of Education (*Phipps*) 9084-6a, 9119-24, 9186-7.

Doing excellent work (*Gilchrist*) 545, 730.

Great assistance to agriculture and admirable school in every way (*Phipps*) 9084-6a, 9086c.

Object of the school (Solomon) 11420, 11550-1.

Ought to have a great future before it (*Fitzmaurice*) 7853.

Position school might occupy if neighbouring counties co-operated as regards agricultural education (Solomon) 11526-39, 11544-5, 11549-51.

Attitude of Agriculturists towards, *see that title.*

Courses of Instruction (Solomon) 11420-2, 11432-3, 11438-41, 11456-64, 11467-8, 11486-505, 11512-30, 11550.

Finance :

Assistance received from Wiltshire County Council (*Fitzmaurice*) 7840a.

Financial position (Solomon) 11417-9, 11506-11.

Would prefer that grants to the school should come from Board of Agriculture (*Phipps*) 9086b, 9118, 9195-9.

Students :

Type of student and their after-careers (*Gilchrist*) 730; (Solomon) 11422, 11442-6, 11471-3, 11550-1.

DAVIES, Mr. H. JONES. *Formerly Chairman of the Carmarthenshire County Council.* (Qualifications of witness, *see* 8249-53, 8272-5.)

Evidence, 8249-8404.

DENMARK. *See under* Colonial and Foreign Countries.

DEVON.

Agricultural Committee, functions of (*Acland*) 2675, 2712.

Attitude of County Council and of farmers in the county to expenditure on agricultural instruction (*Acland*) 2686-7, 2717-40.

Dairy school (*Acland*) 2897.

Lectures (*Acland*) 2640-2, 2756-61.

Scholarships were offered twenty years ago, but were not well taken up and were abandoned (*Acland*) 2643.

DORSET.

Evidence received principally from (Stiby) 12512-12781.

Attitude of County Council towards agricultural education (Stiby) 12514-20, 12566-70, 12640.

Question of co-operating with other counties for the purposes of higher agricultural education (Stiby) 12761-81.

Reading University College, reason for discontinuing grant to (Stiby) 12571-5, 12741-51.

Would like to see an agricultural side to four secondary schools in the county (Stiby) 12535-52, 12720-12731.

Beaminster Grammar School, agricultural side to (Stiby) 12532-6, 12641-2, 12731.

Cost of Instruction (Stiby) 12732-7, 12752-6.

Dairying (Stiby) 12565, 12670-81, 12688-9.

Suggests alteration in method of giving instruction (Stiby) 12602-6, 12682-9.

Dorset—*cont.*

Experiments (Stiby) 12662-3.

Horticultural Instruction (Stiby) 12616-27, 12734.

Manual Processes (Stiby) 12628-38, 12698-716.

Suggests that no instruction should be given (Stiby) 12633-8.

School Gardens (Stiby) 12738-40.

Short Agricultural Courses (Stiby) 12557-64, 12658-61.

DRAWING. *See under* Subjects of Instruction.

DREWITT, Mr. C. J. *Member of the West Sussex County Council.* (Qualifications of witness, *see* 12019.)

Evidence, 12014-12173.

DRUCE, Mr. EDRIC, F.C.S. *Principal of the Ridgmont Agricultural Institute, Bedfordshire.*

Evidence, 3494-3810.

DUGDALE, Mr. J. MARSHALL. *Nominated by the Royal Agricultural Society of England.*

Evidence, 4868-5033.

DUNMOW, AGRICULTURAL AND TECHNICAL SCHOOL AT. *See* "Bigods Hall."

DUNN, Mr. WM. H. *Chairman of the Berkshire County Council.* (Qualifications of witness, *see* 11916.)

Evidence, 11915-12013

DUNSTAN, Mr. M. J. R., M.A., F.R.S.E., F.I.C. *Principal of the South Eastern Agricultural College, Wye.* (Qualifications of witness, *see* 865-7.)

Evidence, 751-881, 1834-1971.

EADY, Mr. C. H. *Farm Steward and Assistant Agent to Lady Wantage, at Lockinge.* (Qualifications of witness and information as to the Wantage Estate, *see* 9354-6, 9393-400, 9402-4, 9454-8, 9476-84.)

Evidence, 9354-9484.

EAST SUSSEX COUNTY COUNCIL. *See* Uckfield Agricultural and Horticultural College.

EASTERN COUNTIES DAIRY INSTITUTE, IPSWICH.

Evidence received principally from (J. A. Smith) 14486-14582.

Attitude of Agriculturists towards, *see that title.*

Courses of instruction (J. A. Smith) 14502, 14510-1, 14520-7, 14575-82.

Are too short (J. A. Smith) 14510-1, 14535, 14538-42.

Farm (J. A. Smith) 14493, 14550-2.

Financial position (J. A. Smith) 14492, 14496-9, 14503-4, 14546-7.

Governing body (J. A. Smith) 14486-8.

No provision in the Eastern Counties previous to the establishment of (J. A. Smith) 14545.

Scholarships tenable at (J. A. Smith) 14492, 14502a-c, 14511.

Staff (J. A. Smith) 14508-9.

Students :

Fees (J. A. Smith) 14519.

Number of (J. A. Smith) 14493, 14548-9.

Residential accommodation for (J. A. Smith) 14515-7.

Type of student and their after-careers (J. A. Smith) 14502a, 14511b-4, 14517-8, 14528, 14567-9.

EFFECT AND VALUE OF AGRICULTURAL EDUCATION.

For information as to the effect produced by instruction in any particular subject, refer to Subjects of Instruction (e.g., under Dairying).

Advance which agricultural education has made in past 17 years (*Eve*) 13036-42.

Advantage for a lad to go to college for about a year (*Eady*) 9405-7.

Effect and Value of Agricultural Education—cont.

- College course will not do much good to a boy of sixteen who is going to carry out the business of a farmer (*Stiby*) 12576.
- College education gives a practical farmer a great advantage over those who have had no such education (*McCracken*) 9242-4.
- College training is necessary to every farmer who is going to farm on a large scale (*McCracken*) 9353.
- Education has made farmers a different class of men to what they were fifty years ago (*Tinniswood*) 7121a, 7172-3.
- Good work is being done by the agricultural colleges (*Langridge*) 10916-22, 10934-8, 10941-3.
- Importance of education in agriculture (*Cockburn*) 10567-8.
- Influence of a short course on the subsequent farming of students (*Davies*) 8335-9.
- Instructor can teach in a few minutes what to acquire by experience would take a long time (*Eady*) 9365-7.
- Land is producing more as result of education (*Davies*) 8322.
- Long course at college unfits lad for farm life (*Eve*) 13076-80, 13084, 13111-8.
- More instruction a farmer has the better (*Peter*) 9792-3.
- Practical results obtained have been remarkably advantageous to the working farmer (*MacDonald*) 11786.
- Scientific instruction enables farmer to obtain larger yield (*Tinniswood*) 7187-91.
- Students have derived more benefit from six months at a farm school than from two years at elementary school (*W. T. Lawrence*) 7254d; (*Tinniswood*) 7159, 7198-201.
- Students should not be too long away from the practical side of farming: two winters is a sufficiently long period for them to be at college (*Peet*) 12399-12402.
- Successful agriculturist must of necessity be thoroughly conversant with science as applied to agriculture (*Grant*) 10429-30.
- Surprising what a vast amount of information acquired by short-course student (*Roberts*) 8113f.
- To gauge the extent of the benefit derived from the instruction given during last 10 or 15 years is, at present, impossible (*Simmons*) 8606.
- Too many students after course at college take up agricultural appointments rather than practical farming (*Hall*) 1542-3.
- Work of the County Councils has on the whole been of an excellent character (*Brooke-Hunt*) 15592.
- Refer also to Attitude of Agriculturists and the work of particular institutions and counties.*

EGERTON, EARL, OF TATTON. *See* (*Young*) 1433-4.

ELEMENTARY EDUCATION. *See under* Previous Education.

ELEMENTARY SCHOOL TEACHERS.**Instruction or Training in Rural Subjects:**

- Approves of such instruction (*Acland*) 2838-45.
- Benefit derived by urban teachers from attending classes in nature study (*Hopkinson*) 8932-3; (*Weiss*) 8941a, 8958-9.
- Board of Education, *see that title*.
- Demand for women teachers who have taken a course in nature study (*Wilkinson*) 11583-5.
- Difficulty in providing supplementary training for teachers engaged in rural areas (*Ogilvie*) 15690p-q, 15691-5a.
- Difficult to get teachers interested in rural subjects (*Bradley*) 8765-6.
- Effect of such instruction (*Amos*) 905-6, 939, 949-50; (*Blackshaw*) 1768-9, 1774; (*Davies*) 8269-70; (*Fisher*) 3040-2; (*Hall*) 1514, 1548-1556; (*Nicholas*) 1038-42; (*Raby*) 1155-9; (*Winter*) 6790-1.
- Greatest need of the present day is an opportunity for affording facilities for acquiring such training (*Sutton*) 4018e.
- Methods by which Board of Education endeavour to supply such training (*Ogilvie*) 15695b, 15707, 16055.
- More encouragement should be given to pupil teachers to obtain such training (*Hobhouse*) 14911-23.

Elementary School Teachers—cont.**Instruction or Training in Rural Subjects—cont.**

- Most necessary that teachers should be trained so as to take an interest in rural subjects (*Langridge*) 10926-33.
- Need for such training (*Hall*) 1514; (*Tinniswood*) 7158; (*Turner*) 7828-30; (*Turnor*) 14330-1, 14380-2, 14433-4, 14479, 14482-5.
- Not possible to earmark any large proportion of future teachers for work in rural areas (*Ogilvie*) 15690p.
- Only since the passing of the Education Act of 1902 that it has been possible for the Board of Education to face the question of providing such training (*Ogilvie*) 15690q.
- Ordinary college staff should not be expected to give vacation courses for (*Dugdale*) 4978-80.
- Question of differentiating between the training of future urban and rural teachers (*Brockholes*) 13722-5; (*Keeble*) 4255-62; (*Roberts*) 8245-8; (*Sutton*) 4020, 4031; (*Turner*) 7831-2, 7945-7, 8017-21.
- Summer vacation courses needed as well as Saturday classes (*Hall*) 1595-6.
- Teachers are anxious to obtain such instruction (*Amos*) 905, 949; (*Dugdale*) 4880.
- Training in rural subjects should be an integral part of the work of all agricultural colleges and pupil-teacher training centres (*Acland*) 2654-6.
- Would like to see it made compulsory for every pupil teacher at a secondary school to receive instruction in botany and the principles of gardening (*Howard*) 7001, 7050-4.
- Provision for such Training at the following colleges and in the following counties:**
- Aberystwyth, University College of Wales (*Davies*) 8269-70; (*Roberts*) 8219-22.
- Armstrong College (*Carrick*) 431-2.
- Bangor, University College of North Wales (*Winter*) 6653i, 6659f, 6789-93.
- Reasons for abandoning such classes (*Winter*) 6659g, 6682-5.
- Basing, Hampshire Farm School (*D. T. Cowan*) 5266-8.
- Cambridge, University of (*Sapwell*) 263-5; (*Wood*) 155-159.
- Cheshire (*Ward*) 4606-13, 4622-3.
- Essex County Technical Laboratories (*Nicholas*) 953.
- Harper-Adams Agricultural College (*Burne*) 5673-6.
- Harris Institute (*Porter*) 13629-34.
- Hereford (*Peet*), 12353-5.
- Holmes Chapel College of Agriculture and Horticulture (*Young*) 1284-5, 1354-7.
- Leeds, University of (*Seton*) 3060-7.
- Manchester University (*Hopkinson*) 8929-33; (*Weiss*) 8941a, 8955-9.
- Midland Agricultural Dairy College (*Blackshaw*) 1768-72.
- Newton Rigg, Cumberland and Westmorland Farm School (*Howard*) 7105-6; (*Tinniswood*) 7158.
- Reading University College (*Percival*) 4348-50; (*Sutton*) 4018e-20.
- For acting teachers (*Childs*) 3992-7; (*Keeble*) 4254.
- Thorough course to enable a student to become a competent teacher in a village school could be given at (*Childs*) 3948, 3954a, 3998-4003.
- Ridgmont Agricultural Institute (*Druce*) 3749-3756.
- South-Eastern Agricultural College (*Amos*) 937-938, 949; (*Dunstan*) 806-9, 822, 1909-14; (*Hall*) 1515; (*Langridge*) 11005-8.
- Swanley Horticultural College (*Wilkinson*) 11582, 11586-90.
- Uckfield Agricultural and Horticultural College (*Langridge*) 11008-11; (*Mannington*) 2096-9; (*Woodhead*) 2189.
- Wiltshire (*Phipps*) 9061-5.

ESSEX COUNTY TECHNICAL LABORATORIES, CHELMSFORD.

- Evidence received principally from* (*Nicholas*) 951-1066, 1188-1238; (*Goodchild*) 1067-1095; (*Raby*) 1096-1159; (*Steel*) 1160-1187.
- Board of Agriculture and Fisheries, relations with (*Nicholas*) 955a, 1219-22.

Essex County Technical Laboratories, Chelmsford—cont.

- Cambridge University, relations with (*Goodchild*) 1067*b*, *k*; (*Nicholas*) 987, 1059–60.
 Distribution of reports, &c. (*Raby*) 1150–4.
 Governing body (*Goodchild*) 1067*a*, 1090–1; (*Nicholas*) 971–77, 1008–13, 1211–3; (*Raby*) 1097–107.
 History of the foundation of (*Nicholas*) 952.
 Labourers, instruction for (*Goodchild*) 1067*g*; (*Nicholas*) 953*g*, 954; (*Raby*) 1116–49.
 Effect of (*Goodchild*) 1067*h*, 1069.
 Visits paid by committees of farmers to Scotland, Holland, &c. (*Goodchild*) 1095; (*Nicholas*) 953*f*, 1014–24.
 Effect of (*Goodchild*) 1067*e*; (*Nicholas*) 1020–2.
Analyses (*Nicholas*) 953*c*, 995, 1200–7, 1233–9; (*Steel*) 1161–71, 1184–7.

Attitude of Agriculturists towards, *see that title*.

Courses of Instruction (*Goodchild*) 1067*c*; (*Nicholas*) 952*a*, 953, 953*g*, 954, 967–70, 986–7, 1025–30; (*Raby*) 1096*a*.

Elementary school teachers, *see that title*.

External Work :

- Experiments (*Goodchild*) 1067*d*; (*Nicholas*) 953*e*, 954–5, 962.
 Gardeners' meetings (*Nicholas*) 963, 1031, 1208–10.
 Lectures (*Goodchild*) 1067*f*, 1083–5, 1090; (*Nicholas*) 960–1; (*Raby*) 1101.
 Market-day lectures (*Nicholas*) 953*b*, 1034–6, 1044.
 Migratory dairy instruction discontinued (*Goodchild*) 1067*c*, 1072, 1076–7; (*Nicholas*) 992.

Finance :

- Financial position (*Nicholas*) 953*a*, 956–9, 978–85, 996–1013.
 Grants from national funds inadequate (*Nicholas*) 955*b*, 1067*j*.
 Sources of income (*Nicholas*) 955*c*, 959.

Scholarships awarded tenable at higher institutions (*Nicholas*) 964–6.

Staff :

- Difficult to retain services of (*Nicholas*) 1190–4.

Students :

- Fees charged to students coming from outside the county (*Nicholas*), 1032–3, 1063–5.
 Instruction given to only a small proportion of the young farmers of the county (*Nicholas*) 1045–9.
 Number of (*Nicholas*) 932*b*, 1037.
 Type of student and their after-careers (*Nicholas*) 988, 990–1, 952*b*.

EVE, Mr. H. TRUSTRAM. *Secretary to, and nominated to give evidence by, the Farmers' Club.* (Qualifications of witness, *see* 12951–9, 12969–72, 12996, 13031.)

Evidence, 12951–13174.

EXAMINATIONS.

Board of Education Examination. *See* Board of Education.

Greater consideration should be given to class records (*MacDonald*) 11800–1, 11883–4.

Many of the present-day examinations cause the curriculum at agricultural colleges to be overcrowded (*Swanwick*) 7637–9, 7752–7.

Should follow the teaching (*Hall*) 1509–11, 1604–5, 1632–6.

Suggestion for establishing a National Diploma in Poultry-keeping (*Brown*) 6171*g*.

Value of an outside examiner :

- An outside examiner should always be associated with a teacher (*Hall*) 1566, 1628–30.
 Comment upon this (*Eve*) 13095.
 Approve of outside examiners associated with the teacher (*Smith-Hill*) 7560–1.
 Outside examiner makes diploma of more value (*Foulkes*) 5817–8.

National Diploma Examinations :

Evidence received from (*Dugdale*) 4868–5033, *representing the Royal Agricultural Society of England, and* (*MacDonald*) 11758–12013, *as regards the Highland and Agricultural Society of Scotland.*

Change likely to be needed (*Macdonald*) 11776.
 Not necessary for the colleges to be represented on the National Diploma Board (*Dugdale*) 5004–5008, 5023–4.

Object of the establishment of (*Dugdale*) 4917–8, 4920; (*Macdonald*) 11762–74.

Examinations—cont.**National Diploma Examinations—cont.**

Question of the control of the, being undertaken by the Board of Agriculture (*Dugdale*) 4921, 4930–4; (*MacDonald*) 11823.

Successful candidates have no difficulty in finding situations (*Dugdale*) 4919.

Time is coming when the central examinations might be superseded by other means (*MacDonald*) 11776–9, 11800*a*, 11823–7, 11830, 11865–7, 11881.

Agriculture :

Comparison between the old Senior examination of the R.A.S.E. and the N.D.A. (*Smith-Hill*) 7549–51.

Examiners discuss informally the doubtful candidates and examine candidates *visu voce* a few hours after reading his papers (*Eve*) 13031, 13124–31.

Excellent examination (*Voelcker*) 13994–8.

Excellent examination: much more appreciated by those who are to become teachers and lecturers than by those who are to be practical farmers (*Smith-Hill*) 7486–90.

Exists as a test of the teaching of the colleges, and as such considers it necessary (*Voelcker*) 13998, 14001–5.

History of the establishment of, number of candidates, fees, &c. (*Dugdale*) 4869, 4871*b*, 4872–7, 4879; (*Eve*) 13032–4.

Most decidedly of opinion that examination should be continued (*Eve*) 13035.

No longer necessary (*Hall*) 1560–73.

Not sufficiently practical (*Foulkes*) 5691; (*Hall*) 1565–8; (*Sapwell*) 242; (*Woodhead*) 2222–6.

Comment upon (*Eve*) 13031*a*.

Out of sympathy with the syllabus and method of conducting the examination (*Dunstan*) 1903–4.

Should be re-modelled and brought more in accordance with the views of existing educationalists (*Dunstan*) 1905–6, 1954–71; (*Hall*) 1565–73.

Thoroughly good examination (*Eve*) 13031.

Would be an improvement if part of the examination were held actually on a farm (*Dugdale*) 4921; (*Eve*) 13048–13049; (*McCracken*) 9263; (*Roberts*) 8147; (*Swanwick*) 7688–90.

Comment upon this suggestion (*Voelcker*) 13999–4000.

Would be an improvement to hold examination at various centres (*Roberts*) 8147–8.

Comment upon this (*Dugdale*) 4922, 5025–6; (*Eve*) 13045–7; (*McCracken*) 9263–5.

Dairying:

Feels that this examination has done its work completely (*MacDonald*) 11828–30, 11878–11880.

History of the establishment of, number of candidates, &c. (*Dugdale*) 4869, 4871*a*, 4877–8.

Opinion as to it being a practical examination (*Ashcroft*) 2411–6.

Question of an advantage being felt by student being examined where he is trained (*Ashcroft*) 2417–9; (*Druce*) 3649–54.

EXPENDITURE UPON AGRICULTURAL EDUCATION.

Agriculturists are not themselves in a position to support to any great extent agricultural education (*Ashcroft*) 2407–9; (*Bickersteth*) 2985–6; (*Childs*) 3910–1; (*MacDonald*) 11789–91.

Any further national grants for agricultural instruction should be administered under the central authority (*Hobhouse*) 15036–8.

Assistance given by the State should be increased (*Turnor*) 14258, 14327, 14376–7.

Board of Education, method of giving grants (*Howard*) 7007–9.

England compares unfavourably with Scotland (*Eve*) 13169–70; *see also* (*Ogilvie*) 16006–14.

Total amount spent on agricultural education is too small (*Hobhouse*) 14996, 15006.

Would justify expenditure upon agricultural education, because agriculturists contribute so largely to the rates (*Chris. Middleton*) 12863.

Expenditure upon Agricultural Education—*cont.***Board of Agriculture :**

Amount from national sources should be increased (*Chris. Middleton*) 12837-44, 12074-7, 12882; (*Lodge*) 5504.

Claim for further national funds is a very strong one (*MacDonald*) 11790.

Earlier grants were given mainly for dairying (*Brooke-Hunt*) 15558.

Education coming under, should not be at a disadvantage as compared with education given by Board of Education (*Phipps*) 9086b.

If more money were given it would be a very good thing for the future of farming in this country (*McCracken*) 9270-4.

Method of allocating grants from (*Bickersteth*) 3101-17; (*Brooke-Hunt*) 15667, 15676-81; (*Carrick*) 350-2, 410-26; (*Childs*) 3906-8, 3038-40; (*Dunstan*) 868-72, 1836-7, 1897-9, 1925-32; (*Inskip*) 3325a, 3326, 3393-5; (*Phipps*) 9077-81; (*Winter*) 6661c; (*Wood*) 43-4; (*W. P. Wright*) 10197-200.

Present sum at the disposal of, is inadequate (*W. P. Wright*) 10194-6.

Should like to see considerable addition to funds at disposal of (*Craigie*) 13187, 13227a.

Supported at one time lectures and the more local work, but have since concentrated their grants more upon permanent centres (*Brooke-Hunt*) 15520, 15522, 15527, 15562-70.

Would prefer, if it were possible, to confine all money going to agricultural education through the Board of Agriculture (*Craigie*) 13229.

Grants from, to agricultural institutions.

For information as to the grant given to any particular institution, see under that institution.

Have remained stationary, in spite of increase of work and expenditure (*Childs*) 3852c, 3852f.

Inadequate (*Benson*) 2580-3; (*Winter*) 6732.

Maximum grant has been fixed by the Board of Agriculture for the highest type of institution, no matter how great the work and expenditure may be (*Brooke-Hunt*) 15667-75.

No hard-and-fast conditions are attached to (*Brooke-Hunt*) 15444-57.

Should be increased and extended to lower grade schools (*Langridge*) 10922-3.

System of giving grants to agricultural colleges has never been seriously attacked (*Craigie*) 13227-8.

Would prefer to see State grants go to the larger institutions, and not considerable sums of money given to purely local institutions (*Craigie*) 13183, 13193-4.

Support given by, to County Councils, and financial relations between Board of Agriculture and County Councils :

Great opportunity lost when the "whisky money" was given over entirely to the County Councils (*Hobhouse*) 14937, 14973-5.

Increased support from national funds would not tend to lower grants from County Council (*Pennant*) 6522-3, 6568.

Little doubt that if the Board offered to assist, the County Councils would be willing to spend more money on agricultural education (*Brooke-Hunt*) 15635-7, 15678-87.

Much more weight given to advice from a Government Department if accompanied by promise of funds (*Hobhouse*) 14974-5, 14995, 15021-5.

No grant from Board given for county work unless it is carried on through a permanent institution (*Brooke-Hunt*) 15578.

Should assist any County Council willing to spend money on agricultural education, and have a voice in the control (*Eve*) 12998-13000, 13083, 13119-22.

Should assist county work (*Fitzmaurice*) 7847; (*Swanwick*) 7662-5.

Should have some power of control over a portion of the "whisky money" (*Campbell*) 11194-6; (*T. W. Cowan*) 14830-3; (*Druce*) 3535-57, 3621-4, 3627-36, 3662-71, 3789-99; (*Hall*) 1491-7, 1580-87; (*Chris. Middleton*) 12877-81.

To elicit local support a grant from national funds is required (*Household*) 8052-5.

Expenditure upon Agricultural Education—*cont.***County Councils :**

Cannot allocate money to the giving of prizes unless instruction has been given (*Simmons*) 8662-6.

Considerable strain on the resources of (*Lodge*) 5485-8.

Cost of elementary education makes it difficult to raise a rate for higher education (*Mannington*) 2039-51.

Do not like spending money unless there is prospect of some near result (*J. W. Smith*) 12284-7.

Effect of a rate on an agricultural county (*Bickersteth*) 2935-7, 2984.

Effect that the Education Act of 1902 has had on the power of County Councils to devote money for agricultural education (*Bickersteth*) 2934b, 3288-96; (*Blackshaw*) 1778; (*Brooke-Hunt*) 15578; (*Childs*) 3852f; (*Cope*) 1643c; (*Davies*) 8294-8; (*Dunn*) 11920-4, 11926-31, 11954; (*Druce*) 3544-53; (*Eve*) 12997, 13082; (*Goaring*) 11119-24; (*Inskip*) 3401, 3446-53; (*Mannington*) 1991-3, 2047-51; (*Roberts*) 8153-4; (*Swanwick*) 7659-62.

Farmers are not so loud in their demand for agricultural education as other classes are for technical education (*Inskip*) 3401.

Farmers have a great dislike to high rates, and have sacrificed agricultural education to save the rates (*Eve*) 12997, 13081-3; refer also to (*Fitzmaurice*) 7847.

Funds at disposal of, are inadequate (*Morgan*) 5986.

Great disinclination to spend "whisky money" (*J. A. Smith*) 14502c.

Income of the local education authority is devoted to a single and complete end; this singleness of aim is best attained by a system which combines the interest of all concerned in the administration of the funds (*Ogilvie*) 15706c.

Money for all forms of higher education is scarce owing to the increased cost of elementary education (*Fitzmaurice*) 7840e, 7847, 7860-2.

No county can maintain every type of institution (*J. W. Smith*) 12278.

Rates should be relieved of the training of elementary school teachers (*Turnor*) 14330-1.

Sum available for agricultural education provided by the County Councils is sufficient (*Craigie*) 13188-92, 13194.

Too much money has been spent by the, on bee-keeping, horticulture and minor subjects, while the colleges have not been adequately supported (*Simmons*) 8616-21, 8657-63, 8682-5 8709-11.

Unless there is some "ear-marked" grant for agriculture, the work will not be extended (*Household*) 8052-5.

Unwilling to give grants towards the more extended courses (*Roberts*) 8111c, 8124-7.

Were provided with a source of income in the Residue Grant distinctly applicable to agricultural education (*Craigie*) 13178a.

Would like to see the "whisky money" more directly earmarked (*Craigie*) 13192a.

Institutions providing Agricultural Instruction :

Dairying education most expensive, and requires larger grants (*Blackshaw*) 1695-701, 1749.

Good results would accrue from, being better equipped with funds (*Beaven*) 14202.

Insecurity of support to, from County Council (*Winter*) 6661d.

Several do not use the financial year for their own purposes (*Brooke-Hunt*) 15550.

Those doing most for agriculture and dealing most with farmers' sons should be most encouraged (*Turnor*) 14278-90.

EXPERIMENTS OR DEMONSTRATIONS conducted by agricultural institutions or by county councils

For information as to experiments conducted by a college or county, see under the particular college or county.

Agricultural societies, whether, would carry on experiments (*Acland*) 2849-60, 2898-901, 2915 2917; (*Swanwick*) 7594.

Are of very great value (*Acland*) 2687; (*Chris. Middleton*) 12814-6.

Experiments or Demonstrations—cont.

- Board of Agriculture should inspect experimental plots and assist local authorities to conduct them on scientific lines (*Hobhouse*) 14942-4.
- Comparative value of soil analyses and experiments as a means of determining manurial requirements of soils (*Percival*) 4304-6.
- Experimental farm, or farm used for instruction cannot be carried on at a profit (*Lawrence*) 7434.
- Experimental work should be supported by national funds (*J. W. Smith*) 12201-6, 12234-47, 12284.
- Extent to which experiments have been carried out in the North of England (*Lawrence*) 7388-92.
- Good deal of money has been wasted on experimental plots (*Hobhouse*) 14942-4.
- Impossible for central institution properly to carry on experiments in the counties (*Percival*) 4107b.
- Some of the experiments conducted by agricultural colleges in this country are not reliable (*Collinge*) 5064-7.

Demonstrations for farmers :

- As regards, this country is ahead of continental countries (*Campbell*) 11226-8.
- Farmers often do not know the result of an experiment conducted on neighbour's farm (*Turnor*) 14301-4, 14405-6.
- For the use of practical farmers, results should be published in a concise and simple manner (*Turnor*) 14305-9.
- Importance of (*Simmons*) 8730-1 ; (*Swanwick*) 7587-9.
- More interest taken by farmers in, than any other form of instruction (*Inskip*) 3341-2 ; (*Seton*) 3074a.
- Most successful farmers take advantage of (*Tinniswood*) 7119a.
- Necessary to keep demonstrating year after year (*Winter*) 6879a.
- Often on too limited a scale (*Kidner*) 6031-8.
- Should not be stationary (*Acland*) 2670, 2868-70, 2921-2 ; (*Percival*) 4169.
- Suggests the establishment of "profit-and-loss" demonstration farms, conducted on commercial lines (*Turnor*) 14302, 14306, 14310-24, 14338-41, 14360-71, 14401-4, 14407-13, 14418-14429.
- Useful means of coming in touch with farmers (*Dunstan*) 879-80.
- Value of (*Eve*) 13028 ; (*Simmons*) 8672-3.

Need for increase of experiments and experimental work :

- Farmers will seldom go to see experiments carried on outside their own county (*Sapwell*) 279-81.
- In every county there should be a complete system of temporary plots for the purpose of testing soils, and one or more permanent manurial stations (*Brooke-Hunt*) 15611-3, 15616-7.
- More demonstration plots needed (*Craigie*) 13217.
- So as to repeat experiments carried out on college farms (*Amos*) 929-30, 934-6 ; (*Fisher*) 3014-5.
- Would like to see demonstration farms greatly increased so as, by means of trying same experiment for two or three years on a great number of plots, to determine definitely certain problems (*Percival*) 4107a, 4111, 4169, 4294-6.

Co-ordination of Experiments :

- Need for further organisation as regards experiments, and especially as to the correlation of results: the question as to whether this could be done by a special committee (*Beaven*) 14156-14158, 14173-6 ; (*Brockholes*) 13714-6 ; (*Brooke-Hunt*) 15611-3, 15618-9 ; (*Brown*) 6185-8 ; (*Campbell*) 11184a, 11214-8 ; (*Dugdale*) 4894-8, 4935-43, 5009 ; (*Dunstan*) 1907-8, 1941-6 ; (*Eve*) 13609-14 ; (*Gilchrist*) 748-9 ; (*Kidner*) 6033-5 ; (*McClellan*) 10039-46 ; (*MacDonald*) 11782-3 ; (*Chris. Middleton*) 12817-20 ; (*Percival*) 4167-70, 4212-4 ; (*J. W. Smith*) 12205-6 ; (*Turnor*) 14439 ; (*Wheeler*) 6411-3, 6442, 6444, 6466-71 ; (*Winter*) 6669.

Experiments or Demonstrations—cont.**Manurial schemes prepared by the Agricultural Education Association and published by the Board of Agriculture :**

- Board of Agriculture should decide what portion should be carried out (*Percival*) 4298-303, 4367-74.
- Experiments have been co-ordinated and improved as result of (*T. H. Middleton*) 15460d.
- Have not been adopted to the extent anticipated (*Foulkes*) 5871-3.
- Have not been altogether successful in co-ordinating experiments (*Dunstan*) 1942, 1947-1952.

EXTENT OF THE PROVISION OF AGRICULTURAL EDUCATION. See under Organisation.

FAITHFULL, Miss. *Warden of the Studley Horticultural College, Warwickshire.*
Evidence, 5294-5410.

FARM HYGIENE. *See under Subjects of Instruction—Veterinary Hygiene.*

FARM INSTITUTES. *See under Institutions.*

FARMERS' CLUB (*Eve*) 12960-8, 12973-4, 13036-42.

FARMING, KNOWLEDGE OF PRACTICAL.

For information as to the amount of practical work done by students at any institution, see under the particular institution, Courses of instruction ; and as to the knowledge of practical farming possessed by students, see the particular institution, Students, type of.

Farmers do not approve of specialised instruction off the farm (*Acland*) 2702-6.

Farmers send their sons to agricultural college to be taught the various sciences, not so much practical farm work (*Amos*) 886-9, 919.

Farming can only be learnt on the land (*Simmons*) 8595-6.

Number of farm operations suitable for boys are limited (*Solomon*) 11465-6.

Too much practical work at a college is liable to prevent students from studying (*McCracken*) 9300.

System of Apprenticing Lads to Farmers or Land Agents :

After-careers of farm pupils (*J. W. Smith*) 12251-12254.

Future farmer should have two or three years with good practical farmer and then attend a course at a school like the Farm School at Basing (*Simmons*) 8678.

Is satisfactory in Scotland (*MacDonald*) 11913-4.

Pupilage with land agent should always be supplemented by full college course (*McCracken*) 9343-9.

Value of (*Goaring*) 11092-4.

Refer also to Scholarships.

Whether an Agricultural Student should obtain his Knowledge of Practical Farming before or after his College Course :

Depends entirely upon the individual (*Foulkes*) 5766-7 ; (*Hall*) 1637-9.

Desirable that agricultural student should have a knowledge of practical farming (*Hale*) 13278-13280 ; (*Kidner*) 6014a ; (*McCracken*) 9286-9290 ; (*MacDonald*) 11804-8 ; (*Chris. Middleton*) 12802, 12866-7 ; (*Peet*) 12397-8 ; (*Seton*) 3049c, 3053 ; (*Simmons*) 8691-7 ; (*Smith-Hill*) 7563-6 ; (*Somerville*) 15115 ; (*Stiby*) 12607-12615 ; (*Tinniswood*) 7160 ; (*Turnor*) 14385-8.

Not always an alternative between taking practical agriculture before or after science, but is very largely an alternative between taking science before agriculture and not taking science at all (*Somerville*) 15115.

Would not approve of making it compulsory that every student should have a knowledge of practical agriculture (*Druce*) 3780-2.

FARRIERS, WORSHIPFUL COMPANY OF.

Evidence received from (*Sheather*) 10759-10892, representing the Company.

Doing good work which should be extended (*Sheather*) 10779-83.

Farriers, Worshipful Company of—cont.**Finance :**

Funds at disposal of, exceedingly small, but are all devoted to the objects of the Company (*Sheather*) 10789-91.
Sources of income (*Sheather*) 10766.
Work has been limited through want of funds (*Sheather*) 10764, 10768.

Registration Committee :

Appointment and constitution of (*Sheather*) 10763-4.
Circulars issued to public bodies (*Sheather*) 10775, 10853, 10869-83, 10887-91.
Examinations (*Sheather*) 10761-2, 10847-52.
Fees charged for registration (*Sheather*) 10766, 10829.
History of (*Sheather*) 10761-3.
Method of conducting (*Sheather*) 10837-42, 10853-60.
Work of (*Sheather*) 10769-73, 10778, 10808-16, 10821, 10846.

FARRIERY. *See under* Subjects of Instruction.

GLOUCESTERSHIRE.

Evidence received principally from (Swanwick) 7585-7771; (Turner) 7772-7839, 7869-8050; (Peter) 9755-9889.

Advice given to farmers (Turner) 7804-11.

Agricultural Committee (Swanwick) 7738-40.

Difficult county to work (Turner) 7918-9.

National Fruit and Cider Institute, relations with (Turner) 7816-20.

Probable lines of development (Turner) 7826, 7833-8, 7869-79, 7887, 7890-8, 7948-55, 7968-71, 7999-8000, 8005-8, 8026-31, 8037-41.

Royal Agricultural College, Cirencester, *see that title.*

Analyses (Turner) 7982-5.

Attitude of Agriculturists, *see that title.*

Classes for Farmers' Sons :**Berkeley :**

Aim of (Peter) 9759c, 9788-91.

Berkeley Hunt Agricultural Society (Peter) 9783, 9787, 9800-1, 9859-61.

Owing to the connection with the Society, the classes have been carried on under peculiarly favourable conditions (Swanwick) 7604b; (Turner) 7822-6, 7920.

Courses of instruction (Peter) 9759b, e, 9784, 9802-7, 9817, 9822-6; (Swanwick) 7604a, 7730; (Turner) 7788, 7792, 7958-61, 8042-5.

Have been carried on for eight years (Peter) 9759f; (Turner) 7965, 8046.

Staff (Peter) 9785-6; (Swanwick) 7606.

Gloucestershire—cont.**Classes for Farmers' Sons—cont.****Berkeley—cont.****Students :**

Difference in the attainments of (Peter)

9759d; (Turner) 7824, 7861-3.

Interest taken by (Peter) 9759d; (Turner) 7790-1.

Number of (Turner) 7789; (Peter) 9759g.

Type of (Peter) 9759f, 9808-9; (Turner) 7963-4, 7967.

Whether similar classes could be organised throughout the country (Peter) 9862, 9872-9.

Charfield (Turner) 7787-93, 7824, 7958-67.

Laverton (Turner) 7787-93, 7824, 7881-6, 7921-7, 7958-67.

Dairying (Peter) 9757a, 9758-9a, 9827-36; (Turner) 7812-5, 7931-7, 7975-87, 7990, 7992-5.

Experiments (Swanwick) 7590-4, 7799-800, 7954-7, 8022-3.

Finance :

Need a grant from Board of Agriculture (Turner) 7903-7.

Present provision for agricultural education insufficient (Household) 8056; (Swanwick) 7656-65; (Turner) 7826-7, 7914-7, 7972-4, 8008-10.

Horticulture (Swanwick) 7597a-603, 7735-7; (Turner) 7778-85.

Lectures (Swanwick) 7586-7; (Turner) 7778-85.

Manual Processes (Swanwick) 7631-2, 7683.

Rural Science Class at Cirencester Grammar School (Swanwick) 7630; (Turner) 7794-8, 7960-1.

Scholarships (Peter) 9837-8; (Swanwick) 7670-5, 7740-1, 7760, 7763-7; (Turner) 7801-3, 7909-13, 8034-7.

Staff :

Inadequate (Turner) 7906.

GOARING, Mr. W. *Lecturer in Horticulture to the Education Committee of East Sussex County Council.*

Evidence, 11026-11134.

GOODCHILD, Mr. T. *Chairman of the Agricultural Sub-Committee of the Essex County Education Committee.*

Evidence, 1067-1095.

GRANT, Mr. W. J. *Director of Agricultural Education for the County of Monmouth.*

Evidence, 10287-10521.

HACKING, Mr. T. *Principal of the Countess of Warwick's School, Bigod's Hall, Dunmow, Essex.*

Evidence, 6907-6996.

HALE, Mr. WINDHAM E. *Vice-Chairman of the Agricultural Sub-Committee of the Lancashire County Council. (Qualifications of witness, 13260-1, 13263-4.)*

Evidence, 13260-13504.

HALL, Mr. A. D., M.A. *Director of the Rothamsted Experimental Station, Harpenden; and formerly Principal of the South Eastern Agricultural College, Wye.*

Evidence, 1479-1639.

HAMPSHIRE. *See under* Basing, Hampshire Farm School at.

HARPER-ADAMS AGRICULTURAL COLLEGE, NEWPORT, SALOP.

Evidence received principally from (Burne) 5542-5685; (Foulkes) 5686-5928.

Advice to neighbouring farmers (Foulkes) 5750-1, 5800-12.

Harper-Adams Agricultural College—cont.

Board of Agriculture, relations with (*Burne*) 5603-6.
Buildings (*Burne*) 5547, 5553.

Gas has not been installed owing to lack of funds (*Foulkes*) 5744-5.

Directions in which work could be developed (*Foulkes*) 5927-8.

Governing Body (*Burne*) 5588-602, 5607, 5682-4.

History of the foundation of the College, information as to the Will of Mr. Harper-Adams (*Burne*) 5544-8, 5555, 5563, 5573-82, 5599, 5614-5; (*Foulkes*) 5757-9, 5768-9, 5792, 5897-9.

Shropshire and Staffordshire gain materially by the Will (*Burne*) 5608-13.

Shropshire and Staffordshire:

Cost of experiments in Shropshire fall on the College (*Burne*) 5559.

County Councils for, are carrying on a certain amount of work not through the College (*Burne*) 5601; (*Foulkes*) 5920-3.

Lectures are given in the counties by College staff (*Burne*) 5560.

Relations with the counties of (*Burne*) 5585, 5599-602, 5661-2; (*Foulkes*) 5753.

Analyses and seed testing for farmers (*Foulkes*) 5739-43, 5746-9, 5840-5, 5852-4.

Attitude of Agriculturists towards, *see that title*.

Courses of Instruction (*Burne*) 5568, 5646-8; (*Foulkes*) 5688-90, 5709-12, 5719, 5723-4, 5783-4, 5830-3, 5860-70, 5890-3, 5912-3.

Elementary school teachers, *see that title*.

External Work (*Foulkes*) 5798-9.

Experiments (*Burne*) 5559, 5625-50; (*Foulkes*) 5725-6, 5730-3, 5847-51, 5871, 5924-6.

Lectures (*Burne*) 5560-2, 5626-37, 5677-9; (*Foulkes*) 5734-8, 5894.

Regret that staff have not been able to give more (*Foulkes*) 5775-6.

Farm (*Burne*) 5552; (*Foulkes*) 5720-3, 5778-80, 5796-7, 5839, 5910.

Finance:

Amount received under the Will of Mr. Harper-Adams (*Burne*) 5546-50, 5580-1, 5656-60, 5685.

Financial arrangements (*Burne*) 5683-5.

More money needed to extend the work (*Dugdale*) 4900-1; (*Foulkes*) 5748.

Receipts from supporting counties (*Burne*) 5549-50, 5585-6.

Work refused owing to lack of funds (*Burne*) 5569-72; (*Foulkes*) 5747.

Research Work (*Burne*) 5649.

Scholarships tenable at (*Burne*) 5550-1, 5564, 5641-4, 5680-1; (*Foulkes*) 5718, 5904-9.

Staff (*Burne*) 5567-8, 5629, 5635-7, 5639-40; (*Foulkes*) 5335-8, 5920-3.

Difficult to retain services of (*Foulkes*) 5773.

Inadequate (*Foulkes*) 5747-9, 5927-8.

Inadequately paid (*Foulkes*) 5927-8.

Salaries insufficient to retain services of (*Burne*) 5565-6, 5570.

Students:

Fees (*Burne*) 5563, 5619-21, 5672.

No old students' organisation (*Foulkes*) 5918-9.

Number of (*Foulkes*) 5698, 5834, 5878-9.

Previous education of, *see that title*.

Residential accommodation (*Burne*) 5554; (*Foulkes*) 5699-705.

Type of student and their after-careers (*Burne*) 5652-5; (*Foulkes*) 5688a, b, 5706-10, 5713, 5717, 5759-63, 5770, 5789-90, 5792, 5819-27, 5880-8, 5903-7.

HARRIS INSTITUTE. *See under* Lancashire.

HEREFORD.

Evidence received principally from (J. W. Smith) 12174-12307; (Peet) 12308-12511.

Agricultural Sub-Committee of the Education Committee (J. W. Smith) 12178, 12180-2.

Question of co-operating with other counties for the purposes of higher agricultural education (Peet) 12426-41, 12443-50, 12484-5.

Secondary schools, deficiency of (Peet) 12457-8, 12486-93.

Would welcome the establishment in the county of a farm school like the one at Basing (Peet) 12448, 12494-8.

Hereford—cont.

Advice and Assistance to farmers (Peet) 12327-8, 12324, 12386-8; (J. W. Smith) 12192-3, 12197.

Giving much information and the sort of information that farmers require (J. W. Smith) 12191.

Attitude of Agriculturists, *see that title*.

Dairying (Peet) 12341-5.

Elementary School Teachers, *see that title*.

Experiments (Peet) 12356-65, 12404-10, 12421-3.

Great need of experiments in the county, but not at the expense of the county (J. W. Smith) 12201-6, 12234-47.

Finance:

Cost of instruction (Peet) 12182, 12411-8.

Present work has been carried on only for about three years, and the Committee have power to spend more money than they actually are spending (J. W. Smith) 12186-90.

Receive no aid from Board of Agriculture (J. W. Smith) 12198-9.

Total cost of printing (Peet) 12337-40.

See also under Experiments above.

Horticulture (Peet) 12346-8, 12384-5.

Lectures (Peet) 12318-21, 12471-9.

Manual Processes (Peet) 12368-72, 12379-83.

Scholarships (J. W. Smith) 12277, 12295-7.

School Gardens (Peet) 12349-52, 12467-70.

Short Agricultural Course (Peet) 12315-7, 12321-3, 12326-31, 12334-6, 12389-94, 12451-6.

Students:

Number of (Peet) 12323.

Some, might benefit by subsequently attending more advanced courses (Peet) 12373-6.

Type of (Peet) 12324-5, 12332-3, 12395-8, 12402-3, 12419-20.

Staff (Peet) 12369-72; (J. W. Smith) 12183-5.

Veterinary Hygiene (Peet) 12366-7.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

Evidence received principally from (MacDonald) 11758-12013.

Assistance given by the Society and the attitude of its members towards agricultural education (Craigie) 13175a; (MacDonald) 11763-6, 11810-6, 11818a, 11820-1.

Memorial to H.M. Government (Craigie) 13176a.

National Diploma, *see under* Examinations.

HILL, Mr. G. W., of Cheshire.

Evidence, 1447-1478.

HOBHOUSE, The Rt. Hon. HENRY. *Chairman of the Education Committee of the Somerset County Council.*

Evidence, 14839-15041.

HOGBEN, Mr. G., M.A. *Inspector-General of Schools in New Zealand.*

Evidence, 14040-14128.

HOLLAND. *See under* Colonial and Foreign Countries.**HOLMES CHAPEL, CHESHIRE, College of Agriculture and Horticulture at.**

Evidence received principally from (Young) 1240-1446; (Hill) 1447-1478.

Advice given to farmers (Young) 1276-9.

Governing Body (Young) 1262-4, 1306-12.

History of the foundation (Ward) 4626-30.

Analyses (Young) 1277-9, 1455-60.

Attitude of Agriculturists towards, *see that title*.

Courses of Instruction (Young) 1246-7, 1253-4, 1299, 1300-1, 1304-5, 1321-2, 1330-5, 1341, 1363, 1381-5, 1396.

Elementary school teachers, *see that title*.

Proposal to start short-courses (Young) 1391, 1426-7.

Holmes Chapel, Cheshire, College of Agriculture and Horticulture at—*cont.*

External Work :

Experiments (*Young*) 1254a, 1255-7, 1271, 1333-8.

Need of further external experiments (*McCracken*) 9221-4.

Lectures (*Hill*) 1452-4, 1461-4, 1473-5; (*Ward*) 4584-92, 4639-57; (*Young*) 1272-5.

More, might be given (*McCracken*) 9218-20, 9224.

Farm (*Young*) 1249-53, 1266, 1369-72.

Finance :

Financial position (*Ward*) 4598-602; (*Young*) 1258-61, 1287-91.

Require larger grant (*Young*) 1287-91.

Sources of income (*Young*) 1259-61, 1269.

Scholarships tenable at (*Young*) 1259, 1366-8, 1392-4, 1421-2, 1435-7, 1443-5.

Staff (*Young*) 1248.

Are overworked (*Young*) 1257, 1272-3.

Students :

Fees (*Young*) 1325-7.

Higher, charged to students from outside the county (*Young*) 1270, 1326-7.

Number of (*Young*) 1242-5, 1342-5, 1373-80.

Previous education of, *see that title*.

Type of student and their after-careers (*Hill*) 1465-8; (*Ward*) 4631-3, 4636; (*Young*) 1243, 1280-3, 1294, 1302, 1313-20, 1323-4, 1359-62, 1364-5, 1401-3, 1446.

HONORARY AGRICULTURAL CORRESPONDENTS.

See under Board of Agriculture and Fisheries.

HOPKINSON, Mr. A., LL.D., K.C. *Vice-Chancellor of the University of Manchester.*

Evidence, 8855-8936.

HOPKINSON, Mrs. *Chairman of the Colonial Branch of the Horticultural College, Swanley.*

Evidence, 11677-11757.

HORTICULTURAL EDUCATION ASSOCIATION.

Evidence received from (W. P. Wright) 10113-10286; (Goaring) 11026-11134, *representing the Association.*

HORTICULTURE. *See under* Subjects of Instruction

HOUSEHOLD, Mr. H. W., M.A. *Secretary to the Gloucestershire Education Committee.*

Evidence, 8051-8099.

HOWARD, Mr. H. C. *Chairman of the Cumberland County Council.*

Evidence, 6997-7111.

HUMPHRIES, Mr. A. E. *President of the National Association of British and Irish Millers. (Qualifications of witness, see 13828-33, 13846, 13899a.)*

Evidence, 13828-13901.

HUNGARY. *See under* Colonial and Foreign Countries.

HUNT, Mr. A. E. BROOKE. *A Superintending Inspector of the Board of Agriculture and Fisheries and Secretary to the Committee. (Qualification of witness, see 15515-8, 15584.)*

Evidence, 15515-15690.

HUTTON FARM. *See under* Lancashire.

HYGIENE. *See under* Subjects of Instruction—Veterinary Hygiene.

INDIA. *See under* Colonial and Foreign Countries.

INNES BEQUEST (*Brooke-Hunt*) 15659b, 15660-2.

INSKIP, Mr. A. *Chairman of the Bedfordshire Agricultural Education Committee.*

Evidence, 3301-3493.

INSTITUTIONS PROVIDING INSTRUCTION IN AGRICULTURE—Institutions other than Elementary and Secondary Schools.

Advantage to have lecturers resident in the counties (*Percival*) 4153, 4181-2.

Agricultural college not required in West of England (*Acland*) 2646-9, 2828-9.

Cannot themselves gauge the good work they have done (*Dugdale*) 4891.

Dairy institutions, probably sufficient provision of, (*Brooke-Hunt*) 15620, 15659a.

Danger of overlapping between (*Winter*) 6878-9, 6889-91.

Farm, essential that agricultural institutions should have a, attached (*Eady*) 9357; (*McCracken*) 9301; (*T. H. Middleton*) 15459c; (*Simmons*) 8742.

Should be a large one (*Simmons*) 8741-2.

For college to be a real centre of information it must be an essential part of the general educational scheme for the area (*Ogilvie*) 15698b.

Good work is being done by (*Langridge*) 10916-22, 10934-8, 10941-3.

Institutions that are doing most for agriculture or dealing most with farmers' sons should be most encouraged (*Turnor*) 14278-90.

No system of provision of schools and colleges can be satisfactory unless it is based upon a clear conception of the requirements of the case (*Ogilvie*) 15696c.

Not always that close bond of union between, and the neighbouring counties, which is desirable (*Brooke-Hunt*) 15586a.

Object is not solely to train students (*Bickersteth*) 2997-8, 3086-91; (*Howard*) 7042-3.

Question of differentiating between various types of institutions (*Dunstan*) 1900-2; (*Hall*) 1601-3; (*Percival*) 4343-5; (*T. H. Middleton*) 15480-91; (*Turnor*) 14470.

Several do not use the financial year for their own purposes (*Brooke-Hunt*) 15550.

Students :

Difference in the attainment of, makes work difficult (*Turner*) 7824-5, 7880-1.

Importance of, residing at the institution (*W. T. Lawrence*) 7275.

Older lads make best student (*Winter*) 6727-8, 6823-30.

Value of a students' association (*Benson*) 2553-4; (*Winter*) 6884-6.

Suggests establishment of Readership in Tropical Agriculture at universities in United Kingdom (*H. S. Lawrence*) 16187-9, 16215-8, 16227-9.

Suggests that at each college a small tract of land should be used for growing fruit and vegetables on a commercial scale and students taught business methods (*Goaring*) 11073-9, 11090-2, 11105-7.

Suggests that, should be encouraged to foster and develop native breeds of stock (*Druce*) 3579, 3593-5, 3655-61; (*Winter*) 6659i, 6841-51, 6859.

Too much attention has been paid to the higher and too little to the lower type of institutions (*Simmons*) 8591-4, 8697-701, 8740.

Work in the West of England would have been more successful if it had been started from a central institution (*Hobhouse*) 14972, 14992-5, 14998-9.

Work of, cannot be judged by the number of students (*Bickersteth*) 2954; (*Brooke-Hunt*) 15590; (*Percival*) 4328-9.

Work of, should be allowed to expand (*Brooke-Hunt*) 15688-9.

Higher Agricultural Institutions :

Advantage of an institution teaching agriculture being closely connected with a University or University College (*Bickersteth*) 2993; (*Cockburn*) 10595-8; (*Hogben*) 1475-7; (*MacDonald*) 11903-4; (*T. H. Middleton*) 15459f; (*Percival*) 4131-3; (*Wood*) 188-90, 192, 198.

Agricultural colleges not of university rank should not attempt to train agricultural chemists (*Voelcker*) 13981, 13985, 14006-12.

Institutions providing Instruction in Agriculture—cont.**Higher Agricultural Institutions—cont.**

- Almost sufficient institutions of highest rank (*Brooke-Hunt*) 15587-8.
- Are an absolute necessity and are doing most valuable work, but do not reach 5 per cent. of the farmers (*Eve*) 12984-8.
- Are necessary for acquiring fresh knowledge and the training of instructors (*Simmons*) 8597-8, 8602.
- Could not also conduct a school of an intermediate type (*Hall*) 1587-91.
- Degrees and diplomas, the question of the uniformity of (*Dunstan*) 844-7; (*Hall*) 1601; (*MacDonald*) 11802-3, 11868-78; (*Woodhead*) 2200.
- Difficult to combine instruction for future farmers and teachers (*Brockholes*) 13731; (*Swanwick*) 7754-5.
- Essential that a first-class institution should have students who desire the highest possible education (*Dunstan*) 855-8, 862-7.
- Functions of institutions of university college type (*Brooke-Hunt*) 15560, 15585-6.
- Instruction given at agricultural colleges in this country is of a very poor nature (*Collinge*) 5064a, 5068-9.
- Long course at a college unfits lads for farm life (*Eve*) 13076-80, 13084, 13111-8.
- Majority of students who go to, either adopt some profession other than farming or else have assistants under them who do the details of the work (*J. W. Smith*) 12555-7.
- Not suitable for future farmers but rather for land agents (*Simmons*) 8744.
- Present supply of, sufficient (*Peet*) 12483.
- Should have a course adapted for those who can only spend one winter at college (*Chris. Middleton*) 12807-11, 12847-59, 12868-9.
- Suggests that students should be allowed to remain in the gardens not as students but more as apprentices (*Miller*) 9631-2.
- Too many students, after a course at college, take agricultural appointments rather than return to farming (*Hall*) 1542-3.
- Ultimate influence of university students compared with those of a provincial agricultural college (*Warren*) 5441-3, 5448-9.
- Work of an agricultural college not of university rank when combined with that of a university conducting research and providing a course for most advanced students, becomes equal to that of a university college (*Brooke-Hunt*) 15586b, 15587a.

Minor Agricultural Institutions :

- Evening classes in agriculture or horticulture, value of (*Goaring*) 11067-72; (*Pennant*) 6582-4.
- In this country there is nothing similar to the Irish Agricultural Stations, and in this respect Great Britain is behind Continental countries (*Campbell*) 11232-3.
- Need of institutions giving instruction in agriculture for lads from 13 to 17 or 18 years old (*Carrick*) 478-88; (*Hacking*) 6939c-e; (*Roberts*) 8212-8; (*Simmons*) 8700-2, 8706; (*Wheeler*) 6401-8; (*Winter*) 6676-81, 6759-76, 6872-4. Refer also to evidence dealing with "Bigod's Hall" and Dauntsey Agricultural School.
- Use of the word "agriculture" in connection with (*Gilchrist*) 733-8.

Agricultural Schools :

- Boys of about 15 years of age are usually in a position to commence agricultural studies (*Solomon*) 11469-70.
- Comparison between agricultural school like Dauntsey and an agricultural college (*Solomon*) 11452-5, 11474-85, 11552-3.
- Functions of (*Brooke-Hunt*) 15662b.
- Highly desirable that, should be encouraged to a limited extent (*Brooke-Hunt*) 15662-4.
- Need for more such schools (*Dunstan*) 1853-8.
- Not approve of (*Sapwell*) 245-6.
- Prefer a school devoted entirely to agricultural and technical work than one giving ordinary secondary education as well (*Peet*) 12497-506.
- Schools similar to Dauntsey would be a success in other counties (*Solomon*) 11451-5, 11474-9, 11483-5, 11535, 11552-3.

Institutions providing Instruction in Agriculture—cont.**Minor Agricultural Institutions—cont.****Agricultural Schools—cont.**

- Would like to see certain intermediate or secondary schools specialise in agriculture (*Davies*) 8287-9, 8356-73, 8386-8; (*Wheeler*) 6448-54, 6461, 6464.

Farm Institutes or Farm Schools :

- Best education for boy going to a farm school is to pass through an elementary school and then go on the land (*W. T. Lawrence*) 7264, 7411-6.
- Danger in work of farm schools overlapping that of higher institutions (*Sutton*) 4018b, 4033-5.
- Does not approve of (*Acland*) 2667-70.
- Each county would not find it profitable to establish a farm school (*D. T. Cowan*) 5245-7.
- Functions of (*Brooke-Hunt*) 15662a.
- Need of more such institutions (*Craigie*) 13210-2; (*Druce*) 3800-10; (*Eve*) 13022-4; (*W. T. Lawrence*) 7270-1; (*Simmons*) 8592-4.
- Possible that instruction similar to that given at Basing Farm School could be given by means of evening classes in centres in the county (*Percival*) 4137-43, 4202, 4308-15.
- Schools of this type most likely to meet the wants of farmers (*D. T. Cowan*) 5283-6.
- Should not take students over 16 (*Sutton*) 4018b, 4033-5.
- Students have derived more benefit from six months at a farm school than from two years at an elementary school (*W. T. Lawrence*) 7254d; (*Tinniswood*) 7159, 7198-201.
- Suggest that such schools do not need a farm as the students are for the most part sons of farmers (*Swanwick*) 7626-9, 7669, 7721-5.
- Value of, to youths whose education must end at 16 (*Childs*) 3869-73.
- Would not approve of establishing technical agricultural schools (*Bickersteth*) 3154-68, 3175-97, 3247-8.

Short Agricultural Courses :

- Advocates a young farmer attending a series of short courses (*Eve*) 13016-21, 13059-64, 13078-13080, 13143-4, 13166-8.
- Approves of (*Hale*) 13287; (*Hobhouse*) 14950-4.
- Are particularly adapted for the ordinary farmer's son (*Dunstan*) 1874-84.
- Better way of instructing young farmers than lectures (*Peet*) 12315-21.
- Comparative value of winter school and short course at a college (*Winter*) 6823-36.
- Course of lectures for youths of 15 to 18, an experiment of holding a (*Druce*) 3568-70, 3768-73.
- Excellent results have followed from extending a few lectures into a proper course of instruction (*Brooke-Hunt*) 15594-600.
- Farmers would welcome evening classes in the winter (*Dugdale*) 4903-5, 4962.
- Good thing if every lad, who is to become a farmer, could attend, a short course (*J. W. Smith*) 12215-6.
- Horticulture, as to establishing a permanent winter school of (*Goaring*) 11109-18, 11129.
- Importance of providing short practical courses which could be attended by the majority of farmers' sons (*Kidner*) 6014a-8, 6030-2, 6053-5, 6085-6, 6118-21, 6128-38, 6146-8.
- Influence of a short course on the subsequent farming of the student (*Davies*) 8335-9.
- Instruction which should be given at (*Simmons*) 8669-71.
- Maximum length of (*Simmons*) 8707-8.
- Money has been wasted on, through students not being sufficiently educated to benefit by instruction (*Hacking*) 6939c.
- Need for more short courses or winter schools (*Brooke-Hunt*) 15594-600; (*Dugdale*) 4984-91; (*Hall*) 1519.
- Only course that touches bulk of farmers (*Eve*) 13016.
- Should be mainly practical (*Hobhouse*) 15009-11.
- Student who is going to be a successful farmer ought to be able to obtain in a six months' course as much information as he requires (*Tinniswood*) 7204-9.

Institutions providing Instruction in Agriculture—cont.**Short Agricultural Courses—cont.**

- Students at, are keener than ordinary college students (*Peet*) 12402-4, 12442.
 Students should not be too long away from the practical side of farming: two winters is a sufficient period for a student to be in college (*Peet*) 12399-402.
 Suggests that the science masters at secondary schools should give instruction at agricultural winter schools (*Swanwick*) 7621, 7653-5.
 Surprising what a vast amount of information is acquired by student at (*Roberts*) 8113f.
 Valuable as a means of instructing the bulk of young farmers (*Dunstan*) 1854.
 Whether short courses should be held in the summer or winter (*Percival*) 4210-1; (*Sutton*) 4059-62.
 Would prefer extended short course to winter school (*Gilchrist*) 552-4.

INTERMEDIATE AGRICULTURAL INSTITUTIONS. See under Institutions.**IRELAND.**

Evidence received principally from (*Campbell*) 11135-11414.

- Demand for agricultural education becomes keener and keener every year (*Campbell*) 11204.
 Department has much wider view of its responsibilities than the Board of Agriculture in England (*Ogilvie*) 16075-6.
 Difficulty arising because of different management, both central and local, for agricultural and elementary education (*Ogilvie*) 15698a, 15700-3.
 In everything the Department of Agriculture does the educational side is kept to the forefront (*Campbell*) 11147.
 Policy of the Department of Agriculture with respect to agricultural education (*Campbell*) 11147, 11181b, 11183.
 Recess Committee's Report (*Campbell*) 11334-42.
 Strength of the Department of Agriculture is that it is fully in touch with all sections of agricultural education and of technical education (*Ogilvie*) 15703.

Agricultural Schools for Girls, annual expenditure on (*Campbell*) 11144a.
 Munster Institute, Cork (*Campbell*) 11174a-7.
 Residential and day schools (*Campbell*) 11177a-11180a.

Agricultural Schools for Males (*Campbell*) 11144a, 11269-11274.
 Agricultural College, Glasnevin (*Campbell*) 11162a-11164, 11166-7, 11371-3.
 Provincial institutions (*Agricultural Stations*), (*Campbell*) 11165a, 11168a-9, 11234-9, 11299-11315, 11374-83.
 Royal College of Science, Dublin (*Campbell*) 11148a-62, 11166-8, 11275-83, 11373.
 Research conducted at (*Campbell*) 11240, 11407-8.
 Winter schools of agriculture (*Campbell*) 11169a, 11174, 11207, 11383-6.

Council of Agriculture and Agricultural Board:
 Constitution and powers of (*Campbell*) 11343-52, 11406.

County Committees:
 Instruction provided by (*Campbell*) 11143a, 11181a, 11204-6, 11208-13.
 Relations with the Department (*Campbell*) 11143a, 11350-5.

Elementary and Intermediate Schools:
 Agriculture is not taught in (*Campbell*) 11181c-11182, 11298-309, 11387-90.

Finance:

- Amount available for agricultural education and methods by which funds are obtained (*Campbell*) 11141-3, 11170.
 Items of expenditure (*Campbell*) 11141-7, 11242-11246, 11266-8.
 No money given to any county unless a rate is raised (*Campbell*) 11143a.
 Work has been facilitated by the fact that the Department has been able to "bank" money not used in any one year (*Campbell*) 11170-3.

Ireland—cont.

- Forestry, School of** (*Campbell*) 11144a, 11180a-1.
Improvement of Creameries (*Campbell*) 11146a, 11265, 11361-4.
Irish Agricultural Organisation Society (*Campbell*) 11144a-6, 11202, 11359-61, 11365-7.
Leaflets, distribution of (*Campbell*) 11404-5.
Live-stock Schemes (*Campbell*) 11142a, 11143c-4, 11147-8, 11205, 11246-64, 11284-94, 11320-3.
Marketing of Irish Produce in Great Britain (*Campbell*) 11146c.
Pioneer Lectures (*Campbell*) 11146d.
Poultry Instruction (*Campbell*) 11142b.
Special Investigations and Experiments (*Beaven*) 14156; (*Campbell*) 11146b, 11411.
Supplemental Schemes in the poorer districts in the West of Ireland (*Campbell*) 11143b.

ITALY. See under Colonial and Foreign Countries.

"JOURNAL OF AGRICULTURAL SCIENCE"
 (*T. H. Middleton*) 15460b.

KEEBLE, Mr. F. W., M.A., D.Sc. Director of the Horticultural Department of the University College, Reading.

Evidence, 4237-4264, 4385-4450.

KENT.

- Experiments with cold storage (*W. P. Wright*) 10174-10175, 10221-5.
 Horticulture (*W. P. Wright*) 10121-6, 10128-30, 10133-5.
 Garden competitions (*W. P. Wright*) 10127-8.
 Regrets that there are no continuation school gardens in (*W. P. Wright*) 10150, 10212, 10231, 10251.
 School gardens (*W. P. Wright*) 10140-3, 10240-6.
 See also under South Eastern Agricultural College.

KIDNER, Mr. S. Member of the Somerset County Council.

Evidence, 6011-6151.

LABOURERS.

- Difficult to find labour (*Langridge*) 10924-5, 10944-9, 10978-80.
 Lectures given by members of college staff are scarcely suitable for (*Sapwell*) 244, 258, 307, 312.
 Schools for, should take students at 13 years of age (*McCracken*) 9316-26.
 System adopted in Worcestershire, of apprenticing boys under practical expert for a course of instruction (*Wheeler*) 6416-20, 6433-5, 6472-3.
 Thinks that if one attempts to teach a working foreman much science it will spoil him (*Eve*) 13065-75.

Provision of Instruction for:

- Instruction should be provided for (*Goodchild*) 1067h, 1069; (*Langridge*) 10937, 10980-3.
 Need for practical schools for labourers (*McCracken*) 9227-34, 9325-9.
 Secret of keeping men on the land is to encourage them to better their position financially (*Simmons*) 8687.
 Suggests that as an experiment a practical school for labourers' sons should be started (*Brooke-Hunt*) 15603-10.

See also under Essex County Technical Laboratories; Ridgmont Agricultural Institute, South Eastern Agricultural College, &c., &c., and also Subjects of Instruction, Horticulture and Manual Processes.

LANCASHIRE.

- Evidence received principally from (*Hale*) 13260-13504; (*Porter*) 13505-13659; (*Brockholes*) 13660-13827.
 Agricultural Sub-committee (*Brockholes*) 13675-9.
 Attitude of County Council towards agricultural education (*Brockholes*) 13680.
 Question of co-operating with other counties and with the University of Manchester for the purposes of agricultural education (*Brockholes*) 13818-27; (*Hale*) 13481-98; (*Porter*) 13634-46.

Lancashire—cont.

Advice and Assistance to Adult Farmers (*Hale*) 13305-13308, 13311-3, 13341-5; (*Porter*) 13529-39.

An extension of the system of personal visits and advice would be appreciated (*Brockholes*) 13681-8, 13770-80.

Attitude of Agriculturists, *see that title*.

Dairying instruction by means of itinerant instructors (*Brockholes*) 13683-5; (*Hale*) 13297, 13339-41; 13347-52, 13462-4; (*Porter*) 13589-99.

Effect of instruction on price of produce (*Hale*) 13551-73, 13453-61, 13600-4.

For fixed dairy school, *see* Hutton Farm below.

Experiments (*Brockholes*) 13708-11, 13792; (*Porter*) 13581-5.

Farriery (*Hale*) 13374-6, 13432-40.

Finance :

Cost of instruction (*Brockholes*) 13801-4; (*Hale*) 13346-9, 13499-500.

Grant given to Liverpool and Manchester Universities (*Brockholes*) 13737-8.

See also under Harris Institute below.

Harris Institute :

Analyses (*Porter*) 13656-9.

Courses of instruction (*Brockholes*) 13674, 13733; (*Hale*) 13265, 13277-8, 13283-4, 13288-93, 13295-7, 13417-31, 13502-3; (*Porter*) 13519, 13553-6, 13560-7, 13575-7.

Elementary school teachers, *see that title*.

Example of an institution in which there has been some difficulty in determining the precise limits of work in respect of which the grants from Boards of Agriculture and Education have been payable (*Ogilvie*) 15696d, 16032-5.

History of the establishment of (*Brockholes*) 13665a; (*Hale*) 13270.

Scholarships, *see below* Scholarships given by the County Council.

Sources of income (*Hale*) 13271, 13329.

Students :

Fees charged to students coming from outside Lancashire (*Porter*) 13647-9.

No fees charged to students from Lancashire (*Hale*) 13325-31, 13404; (*Porter*) 13546-9, 13614-5.

Number of (*Hale*) 13479, 13501; (*Porter*) 13568-75.

Other students than those studying agriculture attend the Institute (*Hale*) 13314, 13477-8.

Previous education of, *see that title*.

Residential accommodation for (*Brockholes*) 13665c; (*Porter*) 13621-3.

Type of student and their after-careers (*Brockholes*) 13725a-7, 13731-3, 13738, 13794-800; (*Hale*) 13266-9, 13277-9, 13282, 13285-7, 13293, 13467-71; (*Porter*) 13512-8, 13520-3, 13549, 13647.

Success of students at National Diploma examinations (*Brockholes*) 13667, 13673-4.

Hutton Farm (*Brockholes*) 13698, 13756, 13787-91, 13793; (*Hale*) 13302, 13315, 13377-9.

Cows at, have suffered severely from tuberculosis (*Brockholes*) 13781-2; (*Hale*) 13383-8, 13406-9.

Dairying and poultry-keeping (*Brockholes*) 13699-13703; (*Hale*) 13265, 13319-24, 13380-3, 13450-1; (*Porter*) 13587-8.

Experimental work (*Brockholes*) 13705.

Students :

After-careers of (*Grant*) 10440.

No fees charged to students from Lancashire (*Hale*) 13325-8.

Number of (*Hale*) 13350-1; (*Porter*) 13586.

Residential accommodation (*Brockholes*) 13665c.

Lectures (*Hale*) 13298-9, 13389-99, 13410-6.

Poultry-keeping, itinerant instruction (*Brockholes*) 13686-7; (*Hale*) 13336-9.

Scholarships given by County Council and tenable at the Harris Institute and at institutions of a more advanced character (*Brockholes*) 13674, 13759-69; (*Hale*) 13332-5, 13400-5; (*Porter*) 13524-8, 13605-13615, 13741-55.

School Gardens (*Brockholes*) 13680.

Staff (*Brockholes*) 13694-7.

LANGRIDGE, Mr. GEORGE. *Late President of the Surveyors' Institution.*

Evidence, 10893-11025.

LAWRENCE, Mr. H. S., *Director of Agriculture in Bombay.*

Evidence, 16134-16272.

LAWRENCE, Mr. W. T. *Manager of the Cumberland and Westmorland Farm School, Newton Rigg.*

Evidence, 7217-7441.

LECTURES, AGRICULTURAL, given to farmers by members of the staff of agricultural colleges and county councils.

Audience :

Are not sufficiently uniform to make lectures successful (*Wood*) 47-51, 104, 177-82.

Farmers will come to lectures to-day, whereas twenty years ago they would not (*Sutton*) 4025-8.

Lectures are not so successful as they should be owing to the previous education of the audiences (*Turnor*) 14252-5, 14350-1, 14393-4.

Lectures are not suitable for labourers (*Sapwell*) 244, 258, 307-12.

Lectures would be more successful if farmers were first led to take an interest in the college (*Turnor*) 14252-5.

Never met with any great amount of prejudice (*Gilchrist*) 692.

Lecturer :

Farmers soon find out if the lecturer is not keeping himself up-to-date (*Cave*) 9565-6.

Lectures are now being given properly (*Brooke-Hunt*) 15592a, 15593, 15602.

Must know his subject from a practical as well as a scientific point of view and be able to impart his knowledge (*Brockholes*) 13690-1; (*Carrick*) 345-7, 386-7; (*Eady*) 9429-36; (*Gilchrist*) 692-3; (*Hobhouse*) 14945-9; (*Simmons*) 8600-1.

Should be attached to an agricultural institution (*Percival*) 4381-4; (*Wood*) 132-6.

Local Organisation :

Success of a lecture often depends on local organisation (*Amos*) 892-8; (*Cave*) 9504; (*Dugdale*) 4892; (*Dunstan*) 803-4.

Subject of :

Should deal with some specific point or the results of experiments rather than general principles (*Bickersteth*) 3217-28; (*Blackshaw*) 1689b, 1690-2; (*Hacking*) 6990-6; (*Hale*) 13389-99, 13410-6; (*Laurence*) 7425-7; (*Pennant*) 6493a; (*Swanwick*) 7704-16, 7734.

Should deal with very definite subjects and not consist of general information (*Hall*) 1484, 1534-7; (*Percival*) 4176, 4190-3.

Value of :

Arouse interest, but leave little permanent impression (*Household*) 8056; (*Turner*) 7785.

Effective as a means of recruiting students for agricultural college (*Cope*) 1651c; (*Gilchrist*) 667; (*Roberts*) 8113e.

Lot of money has been wasted on lectures (*Hacking*) 6939d, 6988-96.

Not of much benefit to farmers (*Hale*) 13302-4, 13389-99, 13410-6.

Not so necessary now that interest in agricultural education has been created (*Craigie*) 13179-80.

Useful means of staff getting in touch with farmers (*Hall*) 1485-6; (*Turnor*) 14256.

Valuable as a means of stirring up enthusiasm (*Dugdale*) 4892.

Where lectures have been given the prejudices of farmers have to a great extent been broken down (*Brooke-Hunt*) 15600-2; (*Roberts*) 8138.

Wherever lectures have been continuously given the instruction has shown a steady rise in character (*Brooke-Hunt*) 15592a.

LEEDS, UNIVERSITY OF.

Evidence received principally from (*Bickersteth*) 2927-2998, 3080-3300; (*Fisher*) 2999-3042; (*Seton*) 3043-3079.

Board of Agriculture, relations with (*Bickersteth*) 2956-8, 2978-9, 3214-6.

Leeds, University of—cont.

- Directions in which development is needed (*Bickersteth*) 3169-74.
- Formation of the agricultural department (*Bickersteth*) 2929-31.
- Governing body (*Bickersteth*) 2942, 2975-9.
- Midland Agricultural and Dairy College, relations with, *see under* the Midland College.
- Publications of (*Bickersteth*) 3256-60.

Attitude of Agriculturists towards, *see that title*.

- Courses of Instruction** (*Bickersteth*) 2944-6, 2955, 2973, 2988-9, 3198-208, 3230-2; (*Seton*) 3044, 3054, 3056, 3079.

Elementary school teachers, *see that title*.

External Work :

- Experiments (*Bickersteth*) 2933b, 2948-9; (*Seton*) 3056a, 3068.
- Farriery instruction (*Bickersteth*) 2952; (*Seton*) 3070-2.
- Horticulture (*Seton*) 3056c-9.
- Centres for teaching fruit culture (*Bickersteth*) 2951; (*Seton*) 3056c-9.
- Lectures (*Bickersteth*) 2949-50, 3217-28; (*Seton*) 3056b, 3069.
- Cannot speak too highly of (*Chris. Middleton*) 12813.

Farm at Garforth (*Bickersteth*) 2933a, 2963-4.

Finance :

- Financial position (*Bickersteth*) 2961-5; (*Seton*) 3047-8.
- Need further assistance from national funds (*Bickersteth*) 2933c-4.
- Sources of income (*Bickersteth*) 3080-4.

Research Work (*Bickersteth*) 3092a, 3096-8, 3148-50; (*Seton*) 3074b, 3075-8.

Scholarships tenable at (*Bickersteth*) 2932, 2953, 3124-3131, 3151-3, 3160-1, 3213, 3233-45, 3265-80, 3297-300.

Staff (*Bickersteth*) 2996, 3217-8, 3253-5; (*Seton*) 3045-6, 3054a.

Students :

- Fees (*Bickersteth*) 2932.
- Number of (*Bickersteth*) 3085-6.
- Previous education of, *see that title*.
- Type of student and their after-careers (*Bickersteth*) 3145-6, 3281-3; (*Fisher*) 3029-30; (*Seton*) 3049, 3053a.

LINCOLN, KESTIVEN DIVISION OF (*Turnor*) 14479-14481.

LIVE-STOCK. *See under* Subjects of Instruction.—Agriculture.

LIVERPOOL UNIVERSITY.

- Information as to the possibility of over-lapping with Manchester University if provision was made for agricultural instruction at Liverpool will be found under Manchester University.

LLEWENNI, DAIRY SCHOOL AT. *See under*, Bangor, University College of North Wales.

LODGE, Sir OLIVER, F.R.S., D.Sc., LL.D. Principal of the University of Birmingham.

Evidence, 5472-5541.

M'CLELLAN, The Rev. J. B., M.A. Principal of the Royal Agricultural College, Cirencester. (Qualifications of witness, *see* 9983-4.)

Evidence, 9890-10112.

MANCHESTER, VICTORIA UNIVERSITY OF.

Evidence received principally from (*Hopkinson*) 8855-8936; (*Weiss*) 8937-8959.

Elementary school teachers, instruction for, *see that title*.

Governing Body (*Hopkinson*) 8934-6.

Length of residence required for a degree (*Hopkinson*) 8925-8.

Present courses of study (*Hopkinson*) 8873-5, 8882-8895.

Suggested lines of development as regards agriculture (*Hopkinson*) 8871-2, 8876-8, 8918-22.

Area from which students are principally drawn at the present time and would be likely to come for agricultural instruction (*Hopkinson*) 8867-9, 8880-1.

Manchester, Victoria University of—cont.

Financial position and prospects (*Hopkinson*) 8858b, 8879, 8896-900.

See also under Lancashire.

Lecturers in economic zoology and botany recently appointed (*Hopkinson*) 8858a.

Work to be undertaken by (*Hopkinson*) 8858a, 8862-4.

Liverpool University, the possibility of over-lapping with, if provision is made for instruction in agriculture at (*Hopkinson*) 8868, 8901-8917, 8922-4.

Work being conducted at present time in subjects bearing on agriculture (*Hopkinson*) 8857-62, 8863a-8866, 8999; (*Weiss*) 8940-6, 8952-4.

McCRACKEN, Mr. W. Agent to the Earl of Crewe and formerly Professor of Agriculture, Royal Agricultural College, Cirencester.

Evidence, 9206-9353.

MacDONALD, Mr. JAMES. Secretary to the Highland and Agricultural Society of Scotland.

Evidence, 11758-11914.

McFADYEAN, Sir JOHN, M.B., B.Sc., F.R.S.E., M.R.C.V.S. Principal of the Royal Veterinary College, London.

Evidence, 9674-9754.

MANNINGTON, Mr. Wm. Chairman of the Agricultural Sub-Committee of the East Sussex County Council.

Evidence, 1972-2153.

MANUAL PROCESSES OF AGRICULTURE. *See under* Subjects of Instruction.

MEAD, Mr. P. J., Acting Director of Agriculture and Co-operative Credit Societies, Bombay. *See* (*H. S. Laurence*) 16163-5, 16168, 16172, 16220-4, 16253, 16271-2.

METEOROLOGICAL OFFICE.

Distribution of the Weekly Weather Report and special harvest forecasts (*Mill*) 6303-6, 6366-7.

Principal duties of (*Mill*) 6333-6, 6343.

METEOROLOGY. *See under* Subjects of Instruction.

MIDDLETON, Mr. CHRISTOPHER. Member of the Council of the Royal Agricultural Society of England. (Qualifications of witness, *see* 12782-8, 12883.)

Evidence, 12782-12908.

MIDDLETON, Professor T. H., M.A., M.Sc. Assistant Secretary to the Board of Agriculture and Fisheries, and Member of the Committee, formerly Professor of Agriculture, Cambridge University. (Qualifications of witness and information as to education, &c., *see* 15437-41, 15482, 15494-5.)

Evidence, 15437-15514.

MIDLAND AGRICULTURAL AND DAIRY COLLEGE, KINGSTON, DERBY.

Evidence received principally from (*Cope*) 1640-1661 (*Blackshaw*) 1662-1833.

Advice and assistance given to farmers (*Blackshaw*) 1680b, 1692; (*Cope*) 1653a.

Board of Agriculture, relations with (*Blackshaw*) 1803-7.

Building accommodation (*Blackshaw*) 1662-4, 1680, 1687-8, 1702, 1705; (*Cope*) 1643a.

Governing Body (*Blackshaw*) 1793-1802; (*Cope*) 1645.

History of the formation of (*Blackshaw*) 1662-4 (*Cope*) 1642-3.

Leeds University, relations with (*Bickersteth*) 2955 (*Cope*) 1643e.

Relations with contributing counties (*Blackshaw*) 1670-1, 1708-9, 1750-2.

- Financial position (*Howard*) 6999-7000, 7026-31, 7061-3, 7077-8, 7080-2 ; (*W. T. Lawrence*) 7433-4, 7440-1.
- Need for further funds (*Tinniswood*) 7154-5.
- Westmorland, proportion of cost borne by (*Howard*) 6999, 7094-6 ; (*W. T. Lawrence*) 7305-8.

- Staff** (*Howard*) 7015 ; (*W. T. Lawrence*) 7248-53, 7256-9, 7383-5.
- Require an increased (*Tinniswood*) 7156-8.

Newton Rigg, near Penrith, Cumberland and Westmorland Farm School at—cont.**Students :**

- Fees (*Howard*) 7041 ; (*W. T. Lawrence*) 7889-97.
- How students are selected (*W. T. Lawrence*) 7281-2, 7286, 7327-30.
- Number of (*Howard*) 7092-3 ; (*W. T. Lawrence*) 7254c, 7284, 7298, 7419-23.
- Could be easily increased by taking pupils from outside the two counties (*W. T. Lawrence*) 7419-7424.
- Residential accommodation is as much as is required at present time, but does not admit of taking pupils from outside the counties (*W. T. Lawrence*) 7239-41, 7282-7, 7329-30.
- Type of student and their after-careers (*Howard*), 7057-9, 7219-22, 7233-4 ; (*W. T. Lawrence*) 7254a, 7255, 7264, 7266-9, 7271-5, 7299-302, 7306, 7354-66 ; (*Tinniswood*) 7202-4.

NICHOLAS, Mr. J. H., M.A. *Secretary to the Essex Education Committee.*

Evidence, 951-1066, 1188-1239.

NORFOLK.

- Aim is to help those that help themselves (*J. A. Smith*) 14502b.
- Farriery instruction has done very good work (*Sheather*) 10819-20.
- Proposal to establish a demonstration farm in, which would be put under the supervision of Cambridge University (*Sapwell*) 241b, 247-51, 275-84, 313.
- Scholarships (*Sapwell*) 241c, 262, 272-4, 290, 314 ; (*J. A. Smith*) 14511b, 14534.

NORTH-EASTERN COUNTY SCHOOL, BARNARI CASTLE.

- Agricultural side has not been taken much advantage of, the farmers being rather indifferent to it (*Gilchrist*) 670-8, 732-8 ; (*Chris. Middleton*) 12804, 12865.
- Would be a loss to the district if the agricultural side was allowed to go down (*Gilchrist*) 625.
- Provides an education at considerably less than cost price (*Chris. Middleton*) 12805-6.
- Students :**
- Instruction has been of benefit to boys who have been unable to proceed to agricultural college (*Chris. Middleton*) 12863-5.
- Type of (*Gilchrist*) 540-1, 670-1.

OFFERTON DAIRY RESEARCH STATION. *See under* Armstrong College.**OGILVIE, Mr. F. GRANT, C.B.** *Principal Assistant Secretary for Technology and Higher Education in Science and Art under the Board of Education* (Qualifications of Witness, *see* 15699a, 15740, 16015-7).

Evidence, 15690-16133.

ORGANISATION AND CONTROL OF AGRICULTURAL EDUCATION.

For information on the subject of finance, see under Expenditure upon Agricultural Education.

- Agricultural education needs looking at as a whole (*Brooke-Hunt*) 15665-7.
- Comparison between systems in England and Ireland (*Campbell*) 11183, 11190-3, 11218-24, 11232, 11358.
- Departmental Committee on Agricultural and Dairy Schools, 1888, (*Craigie*) 13176c.
- Report of, has been largely followed by Board of Agriculture (*Brooke-Hunt*) 15588-9.
- Economy and educational advantage of co-ordinating the various sections of education in a rural area (*Ogilvie*) 15696e-9.
- Education will in the future be taken greater advantage of (*Mannington*) 2115-6.
- History of the origin of the assistance given by the State to agricultural education (*Craigie*) 13175-7, 13178a, 13180.
- In Great Britain there is nothing similar to the Irish Agricultural Stations and in this respect this country is behind continental countries (*Campbell*) 11232-3.

Organisation and Control of Agricultural Education—cont.

- Impossible to benefit agriculture without benefiting other industries (*Turnor*) 14259.
- It is necessary for the State to provide the means of instruction for the sons of larger farmers, but they do not need the personal aid the smaller men do (*Eve*) 12986, 13056, 13134-7.
- Movement for organised agricultural education dates, not from beginning of agricultural depression but from the most palmy and successful days of agriculture (*Craigie*) 13175b.
- Need for a consecutive and complete scheme of agricultural education from elementary school to the higher colleges (*Turnor*) 14231-8, 14247-52, 14258-14259, 14264, 14268, 14275-6, 14330, 14332-7, 14358, 14378-82, 14389.
- No system of provision of schools and colleges can be satisfactory unless it is based upon a clear conception of the requirements of the case (*Ogilvie*) 15696c.
- Person it is most necessary to consider is the working farmer (*J. W. Smith*) 12288-90.
- Reason the State should assist agriculture (*Peter*) 9794, 9813-9.
- Smaller farmers are more difficult to get in touch with (*Hall*) 1529-33.
- Suggests system of travelling fellowships for staff and students (*Winter*) 6663d, 6672-3, *refer also to Staff*.
- Whether there is any inconsistency in the State providing assistance to men employed in agriculture but not to those employed in other industries (*Lodge* 5512-4; (*Morgan*) 5952-8, 6007-9; (*Ogilvie*) 15990-6.
- Whole scheme of education from elementary school through evening classes and secondary schools up to the college or University requires looking at as a whole (*Household*) 8037-86, 8092-8.

Agricultural Societies :

- Part that might be taken by, in regard to agricultural education (*Beaven*) 14205-6; (*Hobhouse*) 14954-5; (*MacDonald*) 11813-21; (*Chris. Middleton*) 12893-7; (*Tinniswood*) 7121a.

County Councils :

- Are being charged with greater powers in educational matters (*Warren*) 5438-40.
- Are likely to neglect higher forms of education (*Hobhouse*) 15006, 15023-4.
- Importance of Education Committees appointing a sub-committee to deal with agricultural education (*Percival*) 4117; (*Stiby*) 12521-12534; (*Sutton*) 4058.
- Comment upon this (*Ogilvie*) 16089-93.
- Importance of the local education authority having direct relation with all education within its area (*Ogilvie*) 15706a.
- Value of an Agricultural Committee appointed by the County Council to deal with agricultural education and all other matters relating to agriculture (*Acland*) 2675, 2712-4; (*Beaven*) 14170; (*Fitzmaurice*) 7840f, 7841-3, 7848-50, 7853-9, 7863-8; (*Grant*) 10412a, 10413-5, 10417, 10487-91; (*Hobhouse*) 14885-8; (*Chris. Middleton*) 12872-3; (*J. A. Smith*) 14533-4, 14570-1; (*Stiby*) 12514-28.
- To appoint such a Committee would effectively cut out the agricultural interests from the region of general and secondary education in the rural community (*Ogilvie*) 15706b.
- Whether, would agree to submit annually to the Board of Agriculture a scheme of agricultural education for the county, and the benefit that would result if this were done (*Acland*) 2673-4; (*Bickersteth*) 2956-8; (*Carrick*) 472-4; (*Dunn*) 11996; (*Eve*) 13159-60; (*Grant*) 10492-5; (*Hobhouse*) 15026-8; (*Phipps*) 9201-2; (*Sapwell*) 294-6; (*Turnor*) 14471-4; (*Wheeler*) 6443-4.
- Work in a county should be done by a staff responsible to the county (*Grant*) 10426, 10436-42.
- Work of the, has on the whole been of an excellent character (*Brooke-Hunt*) 15592.

Extent of the Provision of Agricultural Education :

For information as to institutions, see that title.

Advance which agricultural education has made in the past 17 years (*Eve*) 13036-42.

Organisation and Control of Agricultural Education—cont.*** Extent of the Provision of Agricultural Education—cont.**

- Facilities for educating the farmer's son are as good in this country as on the Continent (*Campbell*) 11229-33.
- Importance of further provision (*Drewitt*) 12171-12173.
- Increase in the provision of agricultural education in the last 20 years (*Craigie*) 13178b, 13180.
- Little provision previous to 1889 (*Davies*) 8256a.
- Local authorities are daily extending their work (*Ogilvie*) 15733.
- No lack of facilities in the North of England (*Chris. Middleton*) 12788, 12792, 12802.
- Provision of higher agricultural education still very defective (*Hobhouse*) 14840.

Government Department or Central Authority :

- Advocates the transfer of the educational powers and duties of the Board of Agriculture to the Board of Education; all educational grants from the State should go through the Board of Education (*Ogilvie*) 15708-14, 15721-2, 15748-15765, 15785-96, 15807-25, 15926-7, 15997-8, 16025-8, 16042-7, 16087-101, 16113-5.
- Arrangement between the Boards of Agriculture and Education by which agricultural teaching other than that of university standard should be subsidised by the Board of Education; and as to whether this arrangement should be revised (*Ogilvie*) 15719-20, 15732, 16042-3, 16115-33.
- Danger of overlapping between Boards of Agriculture and Education (*Lodge*) 5505-6, 5530-5541.
- Differentiation between the functions of the Boards of Agriculture and Education (*Acland*) 2673-4, 2681-3, 2707; (*Turnor*) 14268-74, 14475-8.
- Difficulty arising from dual control (*D. T. Cowan*) 5207, 5239-44.
- Does not, of course, question that Departments of State other than the Board of Education are able to conduct educational work efficiently (*Ogilvie*) 16077-84.
- Farmers are more in sympathy with the Board of Agriculture than with the Board of Education (*Eve*) 13005; (*Nicholas*) 1006-7.
- Great advantage if county officials had to deal with only one central authority (*Howard*) 7007-8.
- In no section of technical instruction other than agriculture does any Department but the Board of Education deal with local authorities or managers of institutions in matters of education in relation to Government grants (*Ogilvie*) 15713.
- Need for co-operation between Boards of Agriculture and Education (*Acland*) 2812; (*Hall*) 1574-80.
- Refers to lack of, and urges necessity for, co-operation between Boards of Agriculture and Education (*Hobhouse*) 14926a-34, 14980-6, 15017-20.
- "Relation" between Boards of Agriculture and Education (*Ogilvie*) 16029-41, 16087.
- State must lead and not wait for demand from the localities (*Brooke-Hunt*) 15689.
- Suggests a joint committee between Boards of Agriculture and Education (*Hobhouse*) 14934-6.
- Wherever there have been two departments responsible for the control of education there have been difficulties and overlapping (*Turnor*) 14264-7.
- Which Government Department should be responsible for instruction bearing on agriculture in elementary schools (*Campbell*) 11181b, 11391-401.
- Would prefer that the Board of Agriculture retained the control of higher agricultural education (*Hall*) 1556-9; (*Phipps*) 9118, 9189-92; (*Sutton*) 4091.

Board of Agriculture and Fisheries :

- Appreciation of the interest which the, have shown in meteorology (*Mill*) 6328-9.
- Assistance to County Councils has been most valuable (*Eve*) 12999-3002, 13153.
- Assists and advises the County Councils (*Brooke-Hunt*) 15573-7.

Organisation and Control of Agricultural Education—cont.**Board of Agriculture and Fisheries—cont.**

- Great benefit to agriculture if the sympathy which exists between the, and the practical agriculturist were extended (*Grant*) 10419.
- Have endeavoured to organise higher agricultural education but have not had the funds to deal with all grades (*Brooke-Hunt*) 15584-6, 15666.
- Have not allowed institutions to spring up at random (*Brooke-Hunt*) 15588-9.
- Have not encouraged institutions to foster and develop native breeds of stock (*Winter*) 6659i.
- Should advise counties as to types of institutions (*Hall*) 1498-9, 1520-5.
- Should have more power of control over agricultural education (*Eve*) 13121-2, 13171-13174.
- Should take a more active part in assisting the establishment of first-class institutions and advising county authorities (*Hobhouse*) 14937-14941, 14949.
- Suggests that the relations between the, and the colleges could be made closer, e.g., Board might publish the results of their experiments (*Rogers*) 15277-93, 15298-306, 15321-3, 15335-45.
- Would like to see the, take up boys when they leave the elementary school (*Wheeler*) 6442.

Board of Education :

- Attitude of, towards agricultural education (*Phipps*) 9118, 9189-92.
- Have recently done a great deal to assist agricultural education (*J. A. Smith*) 14532.
- Making of grants in respect of further education of people already engaged in agricultural occupations is an essential part of the general work of the Department (*Ogilvie*) 15833-40.
- Suggest that the Board of Agriculture might co-operate with and assist the, as regards school gardens and the training of elementary school teachers (*Brooke-Hunt*) 15644-8, 15655-7.

Institutions, Agricultural :

- As to making, responsible for the agricultural education of the affiliated counties (*Dugdale*) 4963.
- Danger of overlapping between (*Winter*) 6878-9, 6889-91.
- If the courses at, are too long, the education is restricted to a few instead of being general (*Kidner*) 6053-5, 6078, 6086.
- Origin of the collegiate centres (*Brooke-Hunt*) 15527 ; (*Craigie*) 13177c.
- Owe their initiation to local desire and local effort, assisted and stimulated by the Board of Agriculture (*Brooke-Hunt*) 15536, 15561.
- Prefer to strengthen existing dairy institutions rather than to establish additional ones (*Ashcroft*) 2441-2.
- Staff working in the counties should be attached to collegiate centre (*Hall*) 1599-600.
- There should be attached to central institution one man, with county for unit, whose sole duty it would be to advise and assist farmers (*Eve*) 12993, 13008, 13051-7, 13096-100.
- Type of institution should be influenced by local conditions (*Hall*) 1498-9, 1538.
- Work of, should be allowed to expand (*Brooke-Hunt*) 15688-9.
- Would like to see in each county an agricultural official attached to the central institution (*Davies*) 8284-6, 8394-6.

Most Suitable Unit for purposes of Agricultural Education :

- County unit (*Brockholes*) 13736 ; (*Craigie*) 13186 ; (*Phipps*) 9077-81 ; (*Wheeler*) 6443.
- Grouping of counties (*Dunn*) 11997-12006 ; (*Eve*) 13148-54 ; (*Simmons*) 8703-5.
- National basis (*Brooke-Hunt*) 15566-70 ; (*Craigie*) 13184-6 ; (*Grant*) 10418-23 ; (*MacDonald*) 11780-3 ; (*Roberts*) 8125-6 ; (*Stiby*) 12596-601 ; (*Swanwick*) 7662-5 ; (*Winter*) 6708-12.

Permanent Consultative Committee, suggestion for appointing a, in connection with the Board of Agriculture and Fisheries :

- Danger of over-centralisation if the Committee attempted to deal with research (*Lodge*) 5515-7.

Organisation and Control of Agricultural Education—cont.**Permanent Consultative Committee—cont.**

- Functions of such a committee (*Acland*) 2751-4, 2791, 2830.
- Larger agricultural societies should be able to furnish whatever a consultative committee could furnish (*Acland*) 2677-9, 2715-6.
- Members from the North of England would probably attend regularly, provided the meetings were not held too frequently (*Gilchrist*) 606, 689.
- Might be a good thing, but would prefer leaving work to the Board of Agriculture (*Dugdale*) 4964-5, 4972, 5009.
- Might be desirable, but committee should have power of allocating increased grants (*J. W. Smith*) 12282-3, 12301-7.
- Might be of value as a channel of information (*Craigie*) 13195-9, 13202-4.
- More effective than present system of Honorary Agricultural Correspondents (*Winter*) 6806.
- Not worth while setting up such a committee unless there were more funds to distribute (*Hobhouse*) 15029-32.
- Prepared to trust the Board of Agriculture without the assistance of a committee, and unless such a committee would be instrumental in obtaining additional grants cannot see that it would be of much use (*Eve*) 13001-4, 13123, 13161-4.
- Should not be responsible for administration (*Acland*) 2741-3.
- Useful, if it had a sum of money with which to assist research (*Hall*) 1606-7.
- Very valuable if it enabled more financial assistance to be given to agricultural education, but its success would very largely depend on its constitution and functions (*Bickersteth*) 2959-60, 3092-5.
- Would be useful (*Amos*) 948 ; (*Carrick*) 503 ; (*Dunn*) 12008-13 ; (*Gilchrist*) 605 ; (*Percival*) 4357-61 ; see also (*Phipps*) 9193-4.

OXFORD, UNIVERSITY OF.

Evidence received principally from (*Warren*) 5411-5471 ; (*Somerville*) 15042-15115.

Forestry School (*Somerville*) 15103-4, 15042c ; (*Warren*) 5411b, 5412-4.

History of the Sibthorpe Professorship (*Somerville*) 15042a ; (*Warren*) 5411a.

Reading University College, for present relations with, see under Reading.

Department of Agriculture, as to the formation of and possible scope of work of the proposed (*Somerville*) 15042b-d, 15042g, 15070-3, 15078-15082, 15098-100 ; (*Warren*) 5411, 5411c, e, 5415-7, 5462-3.

Desirous of seeing such a department formed (*Sutton*) 4092-9.

Financial prospects (*Somerville*) 15042f, 15093-4 ; (*Warren*) 5411d, 5447, 5454-61.

Proposed courses of instruction (*Somerville*) 15042d, 15048-54, 15083-9 ; (*Warren*) 5415, 5420-8.

Provision for instruction in allied sciences (*Warren*) 5418, 5445-6.

Reading University College, instruction given at Oxford would not interfere with (*Percival*) 4319-21 ; (*Somerville*) 15042e, g ; (*Warren*) 5411f.

Research work, prospect of, being conducted (*Somerville*) 15046-7, 15071 ; (*Warren*) 5451.

Students :

Cost to (*Somerville*) 15060-8 ; (*Warren*) 5437, 5452-3.

Length of residence necessary for a degree (*Somerville*) 15095-7, 15102 ; (*Warren*) 5464-71.

Probable number of (*Warren*) 5447-50.

Probable type of (*Somerville*) 15043-5, 15048-15051, 15074-7, 15110-5 ; (*Warren*) 5412-4, 5419-22, 5428-37, 5441-4.

PEET, Mr. J. O., B.Sc. *Organiser of Agricultural Education and Lecturer in Agriculture to the Herefordshire County Council.* (Qualifications of witness, see 12308-14, 12377-8, 12401.)

Evidence, 12308-12511.

PENNANT, Mr. P. P., M.A. *Member of the Council of the University College of North Wales, Bangor.*

Evidence, 6480-6649.

PERMANENT CONSULTATIVE COMMITTEE OF THE BOARD OF AGRICULTURE. *See under Organisation.*

PERCIVAL, Mr. J., M.A. *Director of the Agricultural Department of the University College, Reading.*

Evidence, 4107-4236, 4265-4384.

PETER, Mr. J. *Steward and Land Agent to Lord Fitzhardinge at Berkeley Castle.*

Evidence, 9755-9889.

PHIPPS, Mr. C. N. P. *Chairman of the Wiltshire Agricultural Education Committee.*

Evidence, 8980-9205.

PORTER, Mr. ED., B.Sc. *Secretary of Agriculture for the Lancashire County Council. (Qualifications of witness, see 13506-9, 13558-9, 13650-5; and also (Brockholes) 13694.)*

Evidence, 13505-13659, 13747-55, 13764-9.

POULTRY-KEEPING. *See under Subjects of Instruction.*

PREVIOUS EDUCATION—Education of Agriculturists previous to attending an Agricultural Institution.

General level of trained intelligence of students coming to agricultural college is not as high as one might expect (*Keeble*) 4241b, 4242-4.

Importance of provision being made to allow boys in rural districts to continue their education after leaving the elementary school (*Peter*) 9759g, 9760-9782, 9839-55, 9863-71.

Just as much scientific training can be imparted by taking subjects which come under the head of agriculture as by taking subjects that come under any other head (*Hogben*) 14053.

Lads who are going to become farmers should leave school not later than 16 and go on the land (*J. W. Smith*) 12213-4, 12248-50.

Necessary that agriculture or nature-study should receive a definite place in the school curriculum beginning from the elementary school (*Bradley*) 8758b-66, 8843-9.

Should be *general* not specialised towards agriculture (*Acland*) 2643-6, 2693-6, 2781, 2890-1, 2901-10; (*Bickersteth*) 2938a, 2980-1, 3250-2, 3284-6; (*Dugdale*) 5020-2; (*Fisher*) 3008-11, 3031, 3034-5; (*Foulkes*) 5764-5; (*Percival*) 4135-6; (*Seton*) 3049b, 3050-2; (*J. W. Smith*) 12207-12; (*Smith-Hill*) 7458-64; (*Solomon*) 11544-7; (*Winter*) 6674-5.

Continuation Classes :

Agriculture cannot be taught at (*Acland*) 2650a; see also (*Davies*) 8290-3.

Importance of providing (*Wheeler*) 6421-2.

Instruction given by means of classes meeting two or three times weekly in day or evening throughout the session (*Ogilvie*) 15690m.

Suggests giving instruction in dairying, bee-keeping and poultry-keeping at evening and Saturday classes (*Dugdale*) 4882-90, 4972-7.

Value of (*Acland*) 2650-3.

Elementary :

Boys should be allowed during the last year at school to study text-books bearing on their future occupation (*Wilks*) 13954.

Disadvantage of pupils leaving school at a comparatively early age (*Ogilvie*) 15690j.

Does not develop the powers of observation (*Goaring*) 11054.

Framed too much on urban lines (*Brockholes*) 13717.

Function of an elementary school (*Ogilvie*) 15690b.

Importance of including practical instruction (*Lanbridge*) 10980-1004.

Instruction in rural schools should lean towards the country rather than the town (*Brockholes*) 13717-21; (*Chris. Middleton*) 12845; (*J. W. Smith*) 12220-31, 12265-9; (*Turnor*) 14235, 14345-6, 14392, 14430-2, 14452-5.

Previous Education—cont.

Elementary—cont.

Meteorology, whether instruction in, could be given in elementary schools (*Mill*) 6352-4.

Provision of higher elementary schools and upper classes in elementary schools (*Ogilvie*) 15690e.

Some of the boys who come from elementary schools cannot even sign their own names (*Wheeler*) 6473.

Special instruction in rural elementary schools (*Ogilvie*) 15690c-d, 16063-9.

Suggests that dairy and poultry instruction should be given to girls from the elementary school during school hours as is done in Monmouth (*Grant*) 10309-21, 10471-8.

Teaching of "agriculture" in elementary schools (*Ogilvie*) 15896-917, 16060-4.

Villages should be grouped for purposes of education and the central school made an improvement on present village school (*Household*) 8087-90.

Which Government Department should be responsible for instruction bearing on agriculture in elementary schools (*Campbell*) 11181b, 11391-401.

Nature Study :

Advantage of (*Turnor*) 14234-7.

Approves of (*Sapwell*) 260-2.

Inspectors could give more encouragement to the teaching of (*Dugdale*) 4881, 4995.

Is apt to cause children to destroy plants, butterflies, &c. (*Wilks*) 13952, 13955-7, 13962-72.

Not altogether in favour of (*Drewitt*) 12138-50.

Pupils take more interest in, than almost any other part of school work (*Roberts*) 8119b.

Unless teacher is well trained, may degenerate into mere text-book work (*Campbell*) 11198-

• 11201, 11389-90.

Of Student attending :

Aberystwyth, University College of Wales (*Davies*) 8328-31; (*Dugdale*) 4962.

Armstrong College (*Carrick*) 329-34, 343; (*Gilchrist*) 539-49, 675-9.

Bangor, University College of North Wales (*Dugdale*) 4962; (*Winter*) 6782-8.

Cambridge, University of (*Wood*) 10-15, 115-21.

Harper-Adams Agricultural College (*Burne*) 5556-5558, 5616-8, 5623-5, 5651; (*Foulkes*) 5694-7, 5813-6, 5882-8.

Harris Institute (*Hale*) 13266-9, 13470-6.

Holmes Chapel (*Young*) 1292-3, 1295-9, 1415-8, 1423-4.

Leeds, University of (*Bickersteth*) 2938-9; (*Seton*) 3049a.

Reading University College (*Childs*) 3867; (*Percival*) 4350-3.

Ridgmont Agricultural Institute (*Druce*) 3602-6, 3730-5.

Studley Horticultural College (*Faithfull*) 5310-3.

Uckfield Agricultural and Horticultural College (*Woodhead*) 2195-9, 2211-9.

School Gardens :

Approve of (*Dunstan*) 1871-3; (*Howard*) 7002; (*Stiby*) 12616-27, 12757-60.

Doing good national work (*Brooke-Hunt*) 15644.

Doubtful as to the value of (*Kidner*) 6026-7, 6043-5.

Great deal of good has been done by (*Wilks*) 13948-50.

Ideal school garden is one which gives each child a small piece to grow his vegetables, and also includes a large piece to teach the management of fruit (*W. P. Wright*) 10232-9.

Individual plot system compared with collective plot system (*Ward*) 4320-1.

Need to be managed on very practical lines (*Brooke-Hunt*) 15644-5.

Not always possible to have, even in country districts (*Wilks*) 13950-1; see (*Ward*) 4619.

Parents in some country parishes dislike school gardens (*Acland*) 2657a, 2845-6; (*Bickersteth*) 3209.

Principal defect at present time is the lack of continuation school gardens (*W. P. Wright*) 10150, 10212, 10231, 10251.

Should be extended (*Hobhouse*) 14967-8.

Should be inspected by experts—practical men (*W. P. Wright*) 10143-5, 10231.

Previous Education—cont.**School Gardens—cont.**

- Suggests that the principal of co-operation might be taught by means of groups of (*Bradley*) 8769-70, 8782.
 Value of (*Acland*) 2657; (*W. P. Wright*) 10232, 10245-50.
 Would like to see a garden attached to every rural school (*Langridge*) 10983-99; (*Sapwell*) 261.

Secondary :

- Doubts whether secondary education is necessary for future farmer (*Simmons*) 8622-5.
 Experiment of instruction in rural science being given in secondary school by county agricultural instructor, *see under* Gloucestershire.
 Farmers' sons who go to an intermediate after leaving an elementary school do not return to farming (*Grant*) 10445-6, 10469-72.
 Higher elementary schools, *see under* Elementary above.
 Influence of secondary education on agricultural education (*Acland*) 2885-9; (*Childs*) 3933-5; (*Hacking*) 6939b-e; (*Phipps*) 9105-110; (*Roberts*) 8163, 8186.
 Need of scholarships tenable at secondary schools (*Goaring*) 11054-62.
 Ordinary grammar school education is not suitable for future agriculturists (*Hale*) 13266-9, 13272-13276, 13470-6.
 Poor farmers prefer to have the advantage of their sons' labour than to send them to a secondary school (*Bickersteth*) 2939.

Character of the Education at Secondary Schools :

- Advocates practical training for future agriculturists rather than the ordinary secondary education (*Cockburn*) 10557-66, 10569-70.
 Agricultural sides to secondary schools :
 Approve of (*Kidner*) 6023-5, 6139-43, 6149-51; (*Stiby*) 12535-52, 12638-9, 12643-53.
 Have not usually been successful (*Dunstan*) 1890-1.
 Not approve of (*Eve*) 13058, 13147; (*Sapwell*) 245-6, 266-71, 333-4.
 Not practicable (*Gilchrist*) 546-7, *see also* 548-9, 679-81.
 Agriculture quite out of place in secondary schools (*Hall*) 1512-3, 1608-10.
 Aim and course of instruction in secondary schools (*Ogilvie*) 15690f-h.
 Approves of specialisation if the general education is not neglected (*Gilchrist*) 730-1.
 Education should be general, but there should be small plots of land attached to the school (*Goaring*) 11082.
 Farmers' sons would more largely attend secondary schools if the education was more practical (*Turnor*) 14333-4.
 Instruction in agriculture in a grammar school might be mischievous (*Childs*) 3952-4.
 Local conditions should determine the precise manner in which agricultural teaching should be limited in intermediate education (*Ogilvie*) 15918-23.
 Not desirable in rural district to carry out purely secondary curriculum (*Hacking*) 6910a.
 Rural schools should have a rural bias (*Hobhouse*) 14856-63; (*Turnor*) 14238-46, 14347-9, 14383-5, 14456-61.
 Should teach pure science subjects, but not agricultural science (*W. T. Lawrence*) 7264; (*Peet*) 12457-61, 12492-3; (*Smith-Hill*) 7461-4.
 Specialized courses in secondary schools (*Ogilvie*) 15690g-h.

READING, BRITISH DAIRY INSTITUTE. *See* British Dairy Institute, Reading.**READING, UNIVERSITY COLLEGE.**

- Evidence received principally from (*Childs*) 3811-3922, 3929-4014; (*F. H. Wright*) 3923-3928; (*Sutton*) 4015-4106; (*Percival*) 4107-4236, 4265-4384; (*Keeble*) 4237-4264, 4385-4450.
 Advice given to agriculturists (*Keeble*) 4414-20, 4448-4450.
 Analyses for farmers (*Percival*) 4228-9.

Reading, University College—cont.

- Assistance given to students after completion of course (*Miller*) 9610-4.
 British Dairy Institute, relations with, *see under* British Dairy Institute.
 Directions in which work could be developed (*Percival*) 4230.
 Governing Body (*Childs*) 3812, 3812d, 3814-26, 3912-3.
 History of the formation of the Agricultural and Horticultural Departments (*Brown*) 6155d, g; (*Childs*) 3812-3.
 Legal status of the College (*Childs*) 3874-6.
 London University, relations with (*Childs*) 4008-14.
 Oxford University, relations with (*Childs*) 3812d, 3824-5, 3892-6, 4007; (*Somerville*) 15069.
 For information as to the effect on College at Reading of the formation of an agricultural department within the University of Oxford, *see under* Oxford University.
 Relations with supporting counties (*Childs*) 3973-87; (*Percival*) 4107b, 4331-43.
 Attitude of the county councils towards (*Sutton*) 4037, 4054-8.
See also under Berkshire and Dorset.
 Sphere of influence (*Childs*) 3850-1.
 Attitude of Agriculturists towards, *see that title*.
 Courses of Instruction (*Childs*) 3833-41.
 Agriculture (*Brown*) 6228, 6283, 6286-8; (*Percival*) 4127-8, 4131-3, 4161-5, 4354-6.
 Elementary School Teachers, *see that title*.
 Horticulture (*Keeble*) 4263, 4400, 4434-40.
 Poultry-keeping (*Brown*) 6155e, j, 6193-9, 6225-7, 6259-62, 6286-91.
 External Work :
 Experiments (*Keeble*) 4412-3; (*Percival*) 4107, 4126, 4231-5, 4291-5, 4304.
 As to whether sugarbeet is a crop that could be profitably grown in this country (*Percival*) 4119-26, 4194-7, 4276-81, 4285-4289.
 Lectures (*Keeble*) 4245-7, 4444-7; (*Percival*) 4115-6, 4118, 4153-60, 4176-83, 4226-7; (*Simmons*) 8605, 8655-6; (*Sutton*) 4024.
 Finance :
 Almost impossible to give a correct account of annual cost of instruction in agriculture and horticulture as apart from other instruction (*Childs*) 3905-22, 3956-74; (*F. H. Wright*) 3923-8; *see also* (*Ogilvie*) 16033, 16036-9.
 Amount of capital expenditure (*Childs*) 3852a.
 College endowment (*Childs*) 3877-80.
 County councils, although quite favourable to the College, are unable to give larger grants (*Sutton*) 4036-41.
 Have not the power to increase largely their grants (*Childs*) 3852f, 3905, 3936-9, 3942-7, 3956-7.
 Expenditure is justified although the number of students is not great (*Childs*) 3929-32; (*Percival*) 4328.
 Financial arrangements as regards poultry instruction (*Brown*) 6155f.
 Grant from Board of Agriculture, inadequate (*Childs*) 3852c.
 Receipts from fees (*Percival*) 4364-6.
 Sources of income (*Childs*) 3851.
 Without private generosity agricultural education could not have been carried on at the College (*Childs*) 3852b.
 Farm and Fruit Station at Shinfield (*Brown*) 6245-6; (*Childs*) 3813b; (*Keeble*) 4396-9, 4421-4; (*Percival*) 4185-90, 4266-75, 4282-4.
 Improvement in the quality of milk (*Percival*) 4269-72, 4290.
 Horticultural Department :
 Board of Agriculture refused special grant for (*Childs*) 3852g.
 First institution in the country for men (*Keeble*) 4239.
 Has done most admirable work (*Brooke-Hunt*) 15659b.
 Scholarships for bona fide gardeners founded, but after a few years abandoned (*Keeble*) 4241a, 4244-5.
 Suitability of instruction for Colonial students (*Keeble*) 4385-95; (*Sutton*) 4042-6.
 Work curtailed through lack of funds (*Keeble*) 4415, 4419, 4432-3.

Reading, University College—cont.

Poultry Farm at Theale, equipment, financial position, &c. (*Brown*) 6155i, 6171e, f, 6263-6; (*Childs*) 3813c, 3842-6.

Research Work (*Brown*) 6164a, 6165a, 6200-3, 6263; (*Keeble*) 4239b, 4240-1, 4413, 4432.

Scholarships tenable at (*Percival*) 4322-7, 4375-80. Need for more and value of same (*Percival*) 4203, 4207-9.

Staff (*Childs*) 3896-8; (*Percival*) 4226-7.

Inadequate (*Childs*) 3852d, 3853-4.

Insufficient to carry on research and much external work (*Sutton*) 4029-30.

Students :

Fees (*Brown*) 6228-9; (*Childs*) 3812b; (*Keeble*) 4251-3; (*Percival*) 4204-6.

Higher, charged to students from outside counties (*Childs*) 3851b.

Have not in the past been received from Oxford University (*Somerville*) 15042e, 15056-9, 15090-15092.

Number of (*Childs*) 3849, 3987-91; (*Percival*) 4322, 4328, 4330.

Previous education of, *see that title*.

Residential accommodation (*Brown*) 6181; (*Childs*) 3812a, 3859-62; (*Percival*) 4316-8.

Type of student and their after-careers (*Childs*) 3849, 3863-5, 3867, 3881, 3899-904, 3955.

Agricultural (*Childs*) 3849a; (*Percival*) 4145-4152, 4215-8, 4222-5, 4317-8; (*Sutton*) 4047-8, 4053.

Horticultural (*Childs*) 3849a; (*Keeble*) 4239a, 4241b, 4242-4, 4248-51, 4388, 4401-10, 4425-30; (*Miller*) 9591-4.

Poultry-keeping (*Brown*) 6155k, 6156-64, 6174-81, 6243-4, 6271-2; (*Childs*) 3849c.

REID, Mr. W. F., F.C.S., F.I.C. *Representative of the British Bee-Keepers' Association.* (Qualifications of witness, *see* 14583-7, 14594, 14631, 14637.)

Evidence, 14583-14722.

RESEARCH.

"Journal of Agricultural Science" (*T. H. Middleton*) 15460b.

Legislation should follow on lines indicated by scientific investigation (*J. A. Smith*) 14542-3.

Control of :

Better left to the individual and not controlled by central body (*Beaven*) 14173-8; (*Dunstan*) 1941-6.

To be deprecated (*Winter*) 6663b, 6664-8.

Value of a committee formed for purpose of collating research work (*Hall*) 1606-7.

Encouragement by the State.

Duty of the State to provide for research and investigation because of their importance to all grades of education (*Roberts*) 8171-4.

Method of allocating grants for research (*Dunstan*) 874.

State should give greater support to research (*Acland*) 2665-6, 2684-92, 2734-5; (*Cave*) 9574, 9584; (*Craigie*) 13187; (*J. A. Smith*) 14532-3; (*Wilks*) 13943-7.

Importance and Appreciation of :

Agriculture to-day would be absolutely impossible without research (*Eve*) 12989-90.

Demand for research from farmers and others (*Beaven*) 14190-200.

Farmers generally do not admit the value of research because there has been no means of widely diffusing information thus obtained (*Eve*) 12990-3.

Illustration showing good results that have followed from research (*Beaven*) 14134-41.

Intensely necessary (*Wilks*) 13943-7.

Is indispensable (*Wood*) 203.

Is valued by farmers, but the average farmer thinks a great deal of practice and little of science (*Pennant*) 6600-2.

Research is necessary before the material with which to instruct the intelligent agriculturist is available (*Beaven*) 14179-89.

Very difficult, very tedious, but very necessary (*Beaven*) 14165-6.

Research—cont.**The need for further research.**

Further research necessary (*Beaven*) 14136-7, 14184, 14186-9, 14194; (*Benson*) 2548-52, 2584-93; (*Brown*) 6278-81; (*Cave*) 9574-84; (*Lodge*) 5476-81; (*Mill*) 6329-32; (*Reid*) 14630-14637; (*J. A. Smith*) 14535a-7.

Immense amount of profitable research work to be done, and this should receive greater financial assistance from the State (*Humphries*) 13834-5, 13838a-47, 13849-59, 13867-8, 13886-97.

This country is behind Continental countries as regards research (*Campbell*) 11226-7.

Where, and by whom, research should be conducted.

Advocates more encouragement and facilities for pursuit of research at colleges (*Voelcker*) 13993.

Time available for research at agricultural colleges is practically nil (*Keeble*) 4413.

Agricultural societies should be encouraged to conduct research (*Acland*) 2684a, 2734-5.

Essential that a first-class college should undertake research work (*Campbell*) 11409-10; (*Dunstan*) 848, 873, 1889; (*Wood*) 89-91, 203-5.

Insufficient provision of institutions at which research could be conducted (*Beaven*) 14142-51, 14159, 14203-4.

Relationship between education and research (*Acland*) 2688-90, 2860-6, 2913-5; (*Bickersteth*) 2990-2; (*Brown*) 6182-4; (*MacDonald*) 11809, 11860-5.

Teachers at educational centres have every opportunity of becoming familiar with the needs of the district and are, therefore, more likely to initiate useful research (*Winter*) 6663b, 6670-1.

Unreasonable to expect men engaged in teaching, especially the less advanced work, to undertake research; research can only properly be conducted by people who devote their whole time to it (*Humphries*) 13835a-8, 13848, 13869-78, 13899-901.

With regard to veterinary science, research could be undertaken both at the Royal Veterinary College and certain agricultural colleges (*Cave*) 9574-84.

Would prefer to see research centralised rather than diffused (*Humphries*) 13882-5.

RIDGMONT AGRICULTURAL INSTITUTE, BEDFORDSHIRE.

Evidence received principally from (*Inskip*) 3301-3493; (*Druce*) 3494-3810.

Attitude of Bedford County Council towards, *see below under Finance, Receipts from County Council.*

Building accommodation (*Druce*) 3738-42.

No laboratory or accommodation for doing scientific work (*Druce*) 3570-2.

Cambridge University, relations with (*Druce*) 3757-3763; (*Eve*) 13155-8.

Directions in which work should be developed (*Druce*) 3514-8, 3570, 3641-2, 3743-56.

Governing Body (*Inskip*) 3302-3, 3306a, 3349-64.

History of the formation of the farm school and of the re-construction (*Eve*) 13022a, 13058; (*Inskip*) 3306, 3310-1.

The attempt to teach labourers was started under unfavourable circumstances (*Brooke-Hunt*) 15609-10.

Since the re-construction, the Institute has done excellent work (*Eve*) 13022a.

Attitude of Agriculturists towards, *see that title.*

Courses of Instruction (*Druce*) 3495, 3510-8, 3521-5, 3568, 3607-11, 3675-84; (*Inskip*) 3306b, 3387-93, 3409-17, 3471-3.

Elementary school teachers, *see that title.*

Farm (*Inskip*) 3369-77, 3437-45.

External Work :

Experiments (*Druce*) 3561-3, 3685; (*Inskip*) 3341-4.

Lectures (*Druce*) 3564-7, 3312-3; (*Inskip*) 3459-3462, 3469-70.

Local classes in manual processes and horse-shoeing (*Druce*) 3573-8, 3688-93, 3723-5; (*Inskip*) 3314-24, 3419-27.

Ridgmont Agricultural Institute—cont.**Finance :**

- Financial arrangements (*Inskip*) 3360-5, 3436-8.
 Grants from Board of Agriculture (*Inskip*) 3395, 3453.
 Need of scholarships to enable students to go from Ridgmont elsewhere to receive further instruction (*Druce*) 3533-4, 3612-4, 3618-20 ; (*Inskip*) 3398-9.
 Receipts from County Council (*Druce*) 3625-7 ; (*Inskip*) 3325-40a, 3357-9, 3366-8, 3374, 3394, 3438, 3448-53, 3489-93.
 Sources of income (*Inskip*) 3304-5, 3486-9.
 Work curtailed through want of funds (*Druce*) 3579.

Scholarships tenable at (*Druce*) 3498.

Staff (*Druce*) 3596-600, 3717-22, 3774-9.

Students :

- Fees (*Druce*) 3498-504 ; (*Inskip*) 3306b, 3308-9.
 Higher, charged to students from outside the supporting counties (*Inskip*) 3306b, 3307-9.
 Number of (*Druce*) 3496-7, 3526 ; (*Inskip*) 3384-6.
 Previous education of, *see that title*.
 Residential accommodation (*Druce*) 3726-9, 3738, 3740.
 Type of student and their after-careers (*Druce*) 3497, 3505-6, 3519-20, 3526-9, 3615-7, 3672-4 ; (*Eve*) 13064 ; (*Inskip*) 3310, 3346, 3396-9, 3467-8.

ROBERTS, Mr. T. F., LL.D. *Principal of the University College of Wales, Aberystwyth.* (Qualifications of witness, *see* 8103-4, 8107-9.)

Evidence, 8102-8248.

ROGERS, Mr. A. G. L. *Head of the Intelligence Branch of the Board of Agriculture and Fisheries.* (Qualifications of witness, *see* 15116, 15332, 15363-6, 15436.)

Evidence, 15116-15436.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Evidence received principally from (M'Clellan) 9890-10112.

- Analyses for farmers (*Swanwick*) 7634a, 7684-5.
 Board of Agriculture, relations with (*M'Clellan*) 9995-9997, 10075-7.
 Buildings and equipment (*M'Clellan*) 9946, 10036-8, 10069-73.
 Doing excellent work (*Langridge*) 10918-21, 10938, 11016-22.
 Future of the College if it became a public institution (*M'Clellan*) 10081, 10084-92, 10098-112 ; *see also under* Bristol University College.
 Governing Body (*M'Clellan*) 10021-8.
 History of the establishment of (*M'Clellan*) 9895, 9970-4.
 Question of the possible affiliation to Oxford University (*M'Clellan*) 10085, 10109 ; (*Somerville*) 15097.
 Well qualified to become collegiate centre for Gloucester (*McCracken*) 9339-41.

Attitude of Agriculturists towards, *see that title*.

Courses of Instruction (*M'Clellan*) 9913-5, 9934-7, 9976-81, 10000-5, 10029-35.
 Curriculum is over-crowded ; too ambitious (*Swanwick*) 7637-9, 7750-7.
 Curriculum is suitable for those who attend (*McCracken*) 9266-8.
See also under Forestry below.

Farm and Garden (*M'Clellan*) 9953-69, 9975, 10001-10005, 10019, 10093-7 ; (*Swanwick*) 7725-7.
 Experiments (*M'Clellan*) 9993-4, 9998-9, 10039-10046 ; (*Swanwick*) 7594, 7634-6, 7692.
 Time spent by student on the (*M'Clellan*) 9959-63, 9966-75.

Finance :

- Legal status and information as to bonds, leases, &c. (*M'Clellan*) 9895-912, 9946-58, 10062-9, 10078-80.
 Without assistance from public funds, partly in order to reduce present high fees, the number of students will continue to decrease, and the College cannot be carried on much longer (*M'Clellan*) 10046-61, 10074-7, 10081-4, 10086-10092, 10098-107.

Royal Agricultural College—cont.

Forestry (*M'Clellan*) 9914a, 10002-15.

College has great opportunities for instruction in (*McCracken*) 9269.

Staff (*M'Clellan*) 9976, 9983-92, 10018, 10069-70 ; (*Swanwick*) 7634b.

Students :

- Fees (*M'Clellan*) 9919, 10051-3, 10056.
 Number of (*M'Clellan*) 9920-4, 10057-8, 10085.
 Residential accommodation (*M'Clellan*) 9916-8.
 Type of student and their after-careers (*Kidner*) 6105-6 ; (*M'Clellan*) 9925-33, 9938-45, 10060-10061 ; (*Swanwick*) 7640-1.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Evidence received from (Dugdale) 4868-5033, representing the Society.

- Amount contributed by the Society towards agricultural education (*Dugdale*) 4949-55.
 National Diploma Board, *see under* Examinations.
 Publications of the (*Dugdale*) 4871c, 4923-5, 5000.
 Shows, educational exhibits at (*Dugdale*) 4871d, 4926-7 ; (*Chris. Middleton*) 12883-90, 12898-12908 ; (*Turnor*) 14444-51.
 Farriery competitions at (*Dugdale*) 4928-9.
 System of giving prizes to farmers (*Tinniswood*) 7191a.

ROYAL COLLEGE OF VETERINARY SURGEONS.

(*MacFadyean*) 9682-9.

ROYAL HORTICULTURAL SOCIETY.

Evidence received from (Wilks) 13902-13974, representing the Society.

Conducts examinations for :

- Gardeners in the principles and practice of horticulture (*Wilks*) 13911, 13920, 13927-8.
 Men employed in public parks and gardens (*Wilks*) 13923.
 Teachers connected with elementary and technical schools (*Wilks*) 13921-2.
 An inherent defect in all the examinations of the Society is that the candidates cannot be examined practically (*Wilks*) 13929-31 ; *see (W. P. Wright)* 10273-7.
 Fees charged (*Wilks*) 13924.
 Doing good work in improving practical gardeners (*Wilks*) 13932.
 Financial position (*Wilks*) 13942.
 Research work (*Wilks*) 13940-1, 13974.
 Scholarship awarded annually (*Wilks*) 13939.
 Students taught in the Society's gardens (*Wilks*) 13933-8, 13958-63.
 Used to be associated with the Society of Arts in an examination for gardeners (*Wilks*) 13907-9.

ROYAL METEOROLOGICAL SOCIETY.

Evidence received from (Mill) 6292-6398, representing the Society.

For information as to Meteorology, see Subjects of Instruction.

- Action taken by the Society in connection with the provision of instruction in meteorology at agricultural colleges (*Mill*) 6307-13, 6341-2.
 Financial position (*Mill*) 6362-5.
 Steps taken by the Society to promote interest in, and knowledge of, the science of meteorology (*Mill*) 6293-301, 6325-7, 6357-9.

ROYAL VETERINARY COLLEGE, LONDON.

Evidence received principally from (McFadyean) 9674-9754.

- Has no power to grant a veterinary diploma : this is done by the Royal College of Veterinary Surgeons (*McFadyean*) 9682-9.
 History of the establishment of (*McFadyean*) 9676-81.

Finance :

- Amount of assistance received from the State (*McFadyean*) 9678, 9693, 9731, 9734-43.
 Danger of the work being curtailed through want of funds (*McFadyean*) 9731-3.
 Funds have dwindled until they are on the point of disappearing (*McFadyean*) 9691.
 Need for Government support, *see under* Veterinary Education.
 Royal Agricultural Society gives an annual grant (*McFadyean*) 9707-9.

SAPWELL, B. B. *Member of the Norfolk County Council.*

Evidence, 239-314

SCHOLARSHIPS FOR AGRICULTURAL INSTRUCTION.Advocates system of "open" scholarships (*Hall*) 1500-9, 1539-43, 1616-9.Counties prefer to distribute their own, rather than allow the college to do so (*Davies*) 8389; (*Pennant*) 6577.Many farmers do not know that there are scholarships available (*Chris. Middleton*) 12860, 12870-1.Mistake to make the examination held for the purpose of awarding scholarship too difficult (*Wilkinson*) 11637.More uniformity required as to the length of scholarships awarded by different county councils available at same institution (*J. A. Smith*) 14502a.Need for scholarships to cover cost of six months' training in poultry-keeping (*Brown*) 6171d.Schoolmasters sometimes are averse to giving information about scholarships which would take away his pupils (*Foulkes*) 5908.Suggests that county councils should give scholarships enabling lads to be apprenticed to good practical farmers (*Simmons*) 8626-30, 8674-8, 8711-4.Comment upon (*McCracken*) 9291-9, 9350-3.Will be taken up if the instruction is considered valuable (*Dugdale*) 5013-7.**Amount of Scholarships:**Certain scholarships should, in addition to the payment of fees, provide or partly provide the equivalent of what the holder would otherwise be earning (*McCracken*) 9231-2, 9270, 9274, 9277-9, 9330-2.Should not compensate for loss of holder's wages (*Chris. Middleton*) 12811-2, 12860-2.Should not cover entire cost to holder of maintenance as well as instruction (*Wilkinson*) 11638.**Policy of giving Scholarships** and the type of student to whom they should be given:Danger of instruction not being appreciated when too many scholarships are given (*Winter*) 6868-9.Does not approve of giving higher education free to everyone whether they can benefit or not (*Hale*) 13325-35, 13463-6.Doubtful whether the system is beneficial (*Nicholas*) 964-6.Exceptional lads, scholarships should be available for (*J. W. Smith*) 12216-8; (*Stiby*) 12573-95.Free education is appreciated in New Zealand (*Hogben*) 14111-4.Poverty should not be a qualification (*J. A. Smith*) 14511b, 14534, 14554-66.Prefer to award scholarships without any test or examination (*Davies*) 8381-5.Should only be given to those whose parent's income falls below a certain fixed sum (*Turnor*) 14291.Students with scholarships are not such good workers as those who pay fees (*Young*) 1418, 1421-2, 1435-7.System of scholarships should be developed (*Swanwick*) 7673-5.**SCHOOL GARDENS.** *See under Previous Education.***SCIENCE AND ART DEPARTMENT.** *See under Board of Education.***SCOTLAND, AGRICULTURAL EDUCATION IN.**Evidence received principally from (*MacDonald*) 11758-11914.As to the need for institutions providing less advanced agricultural instruction (*Ogilvie*) 15863-7.Change in the attitude of farmers towards agricultural education (*MacDonald*) 11831-2, 11834.England compares unfavourably with (*Eve*) 13169-70. Farmers in Scotland would welcome a scheme for improving live-stock (*MacDonald*) 11841-50.**Scotland, Agricultural Education in—cont.**Greatest possible advance made in agricultural education in Scotland as a result of the transfer of the agricultural colleges in Scotland to the Scotch Education Department (*Ogilvie*) 15699b, 15854-8, 15999-16006.No organised system for instructing labourers, farmers themselves are able to undertake this (*MacDonald*) 11848-50.Teaching of history (*Ogilvie*) 15870-1.**Agricultural Colleges:**Are now under the Scotch Education Department (*Brooke-Hunt*) 15530.County councils provide about one-half the funds for (*MacDonald*) 11911-2.Grants to (*Ogilvie*) 16006-14.Number of, and scope of their work, &c. (*MacDonald*) 11831, 11833, 11885-95, 11900-2, 11911-2; (*Ogilvie*) 15859-62, 15868-9.Scotch Education Department have been generous to (*MacDonald*) 11793-4.**Students:**Previous education of (*MacDonald*) 11835-11840, 11908-9; (*Ogilvie*) 15863-4.Type of student and their after-careers (*MacDonald*) 11796-9, 11804-8; (*Rogers*) 15431-4.**SEALE-HAYNE BEQUEST.** (*Acland*) 2658-9, 2827; (*Brooke-Hunt*) 15587b.**SECONDARY AGRICULTURAL INSTITUTIONS.** *See under Institutions.***SECONDARY EDUCATION.** *See under Previous Education.***SETON, Prof. R. S., B.Sc.** *Professor of Agriculture, Leeds University.*

Evidence, 3043-3079.

SHEATHER, Mr. CHAS., F.R.C.V.S. *Master of the Worshipful Company of Farriers.*

Evidence, 10759-10892.

SHORT AGRICULTURAL COURSES. *See under Institutions.***SIMMONS, Mr. W. ANKER.** *Member of the Firm of Messrs. Simmons & Sons, Land Agents, &c., Henley-on-Thames, Basingstoke, and Reading. (Qualifications of witness, see 8578-90, 8739.)*

Evidence, 8578-8744.

SMITH, Mr. H. HAMEL. *Lately resident in the West Indies.*

Evidence, 8960-8979.

SMITH, Mr. J. A. *Principal of the Eastern Counties Dairy Institute, Ipswich. (Qualifications of witness, see 14490, 14504-7.)*

Evidence, 14486-14582.

SMITH, Mr. J. W. *Member of the Herefordshire County Council. (Qualifications of witness, see 12175-9, 12291-4.)*

Evidence, 12174-12307.

SMITH-HILL, Mr. J., B.A., B.Sc. *Principal of the Aspatria Agricultural College, Carlisle. (Qualifications of witness, see 7443-4, 7540.)*

Evidence, 7442-7584.

SOLOMON, Mr. F. O. *Headmaster of the Dauntsey Agricultural School, West Lavington, Wilts. (Qualifications of witness, see 11415-6.)*

Evidence, 11415-11555.

SOMERSET.

Evidence received principally from (Kidner) 6011-6151 ; (Hobhouse) 14839-15041.

Agricultural Instruction Committee (Hobhouse) 14866-14874, 14888-90.

As to establishing an agricultural college for (Hobhouse) 14842-5.

Question of co-operating with Cirencester, Bristol or Oxford for purposes of higher agricultural education (Hobhouse) 15033-5.

Attitude of Agriculturists, *see that title*

Cost of Instruction (Hobhouse) 14999.

Dairy School (Hobhouse) 14990.

Experiments (Hobhouse) 14997-8 ; (Kidner) 6034-40, 6125-7.

Experimental farm given up owing to local opposition (Hobhouse) 14891-5, 14900.

Farriery (Kidner) 6047-52.

Lectures (Kidner) 6020-2, 6046-8.

Manual Processes (Hobhouse) 15012-4.

Scholarship (Hobhouse) 14846-56, 14905-9, 14976-9, 15001-4.

Secondary Schools :

At three, in the county education bearing directly on rural subjects is given (Hobhouse) 14860, 15000, 15004 ; (Kidner) 6023-5, 6139-43.

Staff (Kidner) 6046, 6124.

Lack of practical knowledge (Kidner) 6036-40, 6068-72, 6124.

Veterinary Hygiene (Hobhouse) 14963-4.

SOMERVILLE, Prof. WM., D.Sc. *Professor of Rural Economy, University of Oxford, and a Member of the Committee.*

Evidence, 15042-15115.

SOUTH-EASTERN AGRICULTURAL COLLEGE, WYE.

Evidence received principally from (Dunstan) 751-881, 1834-1971 ; (Amos) 882-950.

Advice and information given to farmers (Amos) 910, 916-8 ; (Dunstan) 812-3, 823.

Buildings, cost of, &c. (Dunstan) 752, 756-7, 761-3.

Governing Body (Dunstan) 753-4.

Labourers, instruction for (Dunstan) 1840, 1849-50, 1859-65, 1868-73, 1885-9.

Managed under a scheme of the Charity Commissioners (Dunstan) 752, 855-7, 1933-5.

Publications of the (Dunstan) 851-2.

Attitude of Agriculturists towards, *see that title*.

Courses of Instruction (Dunstan) 769-86, 805-9, 825, 833-4, 840-7, 1840-1, 1845-50 ; (W. P. Wright) 10172.

Elementary School Teachers, *see that title*.

Forestry (Dunstan) 786, 875-8, 1936-40.

Veterinary Hygiene (Cave) 9490-6, 9510-5, 9537-9540, 9545, 9549, 9558.

Correspondence courses (Dunstan) 818-21.

Instruction in horticulture and fruit-growing needs developing (Dunstan) 1834.

Short courses for farmers' sons impossible owing to lack of accommodation (Dunstan) 1881-4.

External Work :

Experiments (Dunstan) 814-7.

Farriery instruction (Dunstan) 811.

Lectures (Cave) 9505 ; (Dunstan) 802-4.

Suggests that fruit stations in connection with the College should be established throughout Kent, because Wye is not easily accessible to the large growers (W. P. Wright) 10176, 10183.

Farms (Dunstan) 787-8, 793, 800-1, 814-5.

Finance :

Annual expenditure (Dunstan) 826.

Capital outlay, *see under Buildings above*.

Debt on College (Dunstan) 765-6, 768, 838-9.

Long struggle against poverty (Hall) 1490.

Sources of income (Dunstan) 827.

Total receipts from the counties (Dunstan) 764.

And from the Board of Agriculture (Dunstan) 765.

South-Eastern Agricultural College, Wye—cont.

Research Work (Cave) 9516-22 ; (Dunstan) 810, 829, 848-52.

Has been hampered through want of funds (Cave) 9584.

Staff (Hall) 1487.

Difficulty of retaining the services of (Hall) 1613-5.

Inadequately paid (Dunstan) 830-2.

Require additional, to allow of visits being paid to farms (Amos) 909-10.

Students :

Fees (Dunstan) 789-90.

Number of (Dunstan) 757, 780-1.

Residential accommodation for (Dunstan) 792-4.

Additional required (Dunstan) 1838-9.

Type of student and their after-careers (Dunstan) 758-60, 790, 795-9, 855, 858-9, 1844, 1918-24 ; (Hall) 1479.

STAFF, AGRICULTURAL, of colleges and county councils.

Demand for :

Great demand for highly-educated scientific agriculturist (Foulkes) 5771-2.

Great opening for trained forestry instructors (McClellan) 10017-8.

Shortage of good agricultural teachers (Peter) 9796-9.

Qualifications of :

Advantage if, could be drawn from the farming class (Fisher) 3013.

At some higher agricultural institutions the staff are not competent (Collinge) 5064a, 5068.

Difficult to get practical men with scientific knowledge (Brockholes) 13691-7, 13785-6.

Everything depends on the instructor (Hale) 13307-8.

If instructor does not possess the confidence of the farmers he is doing more harm than good (Beaven) 14172 ; (Eve) 12979.

Large proportion of teachers and instructors have been brought up on the land (Simmons) 8603-5.

Comment upon (Eve) 12980-2.

Man straight from college is not suitable for county instructor (Eve) 13050-5 ; (Kidner) 6028-9.

Must show farmers they understand the subject from the practical side (Eady) 9362 ; (Eve) 12979 ; (Kidner) 6029, 6058-66, 6069-72.

Some county council instructors have done more harm than good (Turnor) 14394-6.

See also under Lectures—Lecturer.

Salaries of :

Difficulty in retaining services of members of college staff (Blackshaw) 1818-20 ; (Hamel-Smith) 8975-6 ; (Pennant) 6494, 6516, 6524-9.

Low salaries paid at Welsh colleges (Winter) 6661e-3a.

Posts abroad, higher salaries of (Dunstan) 857-61.

Remuneration often inadequate (Burne) 5565-6 ; (Dugdale) 4900.

Salaries offered to county instructors have practically prevented the posts being open to suitable people (Eve) 13101-9.

Stipend remuneration has increased in the last few years (Childs) 3852d.

Training of :

For the training of teachers a fuller course is needed (MacDonald) 11788, 11857-8.

If agricultural education is to be a success, teachers must be well trained (Campbell) 11197a.

Should be taught to teach (Eve) 12982-3.

Should take a more complete course than can be obtained at an agricultural college (Dunstan) 1516-8.

Teachers who deal with practical agriculture are unsatisfactory because they spread their energies over the whole subject, which is too wide for one man (MacDonald) 11852-6, *see also* (T. H. Middleton) 15448e.

Travelling Scholarships :

Value of, and need for (McCracken) 9260-2 ; (Hamel-Smith) 8973, 8977 ; (Winter) 6663d, 6672-3, 6807-9.

STIBY, Mr. C. B. *Alderman of the Dorset County Council.* (Qualifications of witness, *see* 12523, 12607-12609, 12664-9.)
Evidence, 12512-12781.

STUDLEY HORTICULTURAL COLLEGE, WARWICKSHIRE.

Evidence received principally from (Faithfull) 5294-5410.

Application recently made to Board of Education for a scheme for the future regulation of the College (Faithfull) 5332-6, 5387-9, 5405-9.

Exhibits at local shows (Bradley) 8788; (Faithfull) 5390-1.

History of the establishment, and of the transfer from Reading (Dugdale) 4906-8; (Faithfull) 5295.

Supplies a want (Dugdale) 4916.

Courses of Instruction (Bradley) 8802-3; (Dugdale) 4908-14; (Faithfull) 5295b, 5296-302, 5306-10, 5314-5, 5342, 5355-81.

Would be more satisfactory if the students had the management of the farm (Faithfull) 5295a, 5337-42, 5353-5.

Finance :

Butter is made at a loss (Crooke) 4747-51.

Receive no grants from public bodies (Faithfull) 5316-9, 5399-404.

Scholarships tenable at (Faithfull) 5322-3, 5384.

Staff (Faithfull) 5303-5.

Students :

Fees (Faithfull) 5320.

Number of (Crooke) 4694, 4763-7; (Faithfull) 5295b.

Previous education of, *see that title.*

Residential accommodation for (Faithfull) 5320-1.

Type of student and their after-careers (Bradley) 8758b-60, 8838-41, 8854; (Dugdale) 4911, 4915; (Faithfull) 5328-31, 5344, 5382-3, 5396-8.

SUBJECTS OF INSTRUCTION.

For information as to subjects taught at particular institutions, see under the various institutions.

Agricultural History or Economics :

Value of instruction in (Percival) 4165-6; (Wood) 109-13; (Young) 1339-40.

Agriculture :

Farmers have no business to use artificial manures (Eady) 9442-6, 9469-72.

Suggests method by which student while at college would not lose touch with values (McCracken) 9302-10.

Teaching at some institutions is of too local a character (McCracken) 9257-60.

Teaching of practical agriculture has not been altogether satisfactory (MacDonald) 11786, 11851-6.

Live-stock :

Impossible to teach at college the value and weight of stock (Eady) 9410-3.

Management of stock, the teaching of the, is unsatisfactory at agricultural institutions (Druce) 3695-6, 3709-16.

Suggests that students should visit slaughter-houses and receive instruction as to weights and values of live-stock (McCracken) 9235-47, 9280-5, 9311-5.

Valuation of cattle by live weight (Svanwick) 7718-20.

Bee-keeping :

Advantages of keeping bees (T. W. Cowan) 14742; (Reid) 14590-2, 14629, 14666-7, 14691-14694, 14704-6, 14711-5.

Assistance given in foreign countries to instruction in bee-keeping (T. W. Cowan) 14760-3.

Experimental work should be encouraged by the State (T. W. Cowan) 14788-99.

Experts in bee-diseases (T. W. Cowan) 14805-11, 14814-6; (Reid) 14664-5.

Financial results which follow from instruction in (T. W. Cowan) 14767-8.

"Foul-brood" is quite within the power of bee-keepers to control and its presence is an indication of the want of education (Reid) 14656-62.

Subjects of Instruction—cont.

Bee-keeping—cont.

Great increase in the production of honey would result from the further diffusion of information (T. W. Cowan) 14786a-7.

Imports of honey into this country are considerable, all of which could be produced here (T. W. Cowan) 14764-7, 14817-25.

Instruction in, should be encouraged (Brooke-Hunt) 15626.

Instruction is of value (Hobhouse) 14957-62.

Instructors in, are not always competent (Reid) 14622-3, 14682, 14686-7, 14716-21.

Methods and cost of instruction (Reid) 14669-79, 14701-10; *see also under Surrey.*

Quality of honey is improving (Reid) 14617.

State assistance to bee-keeping, *see under* British Beekeepers' Association.

Biology :

Has been neglected in this country (Collinge) 5036, 5045-6, 5068-9.

Book-keeping :

Importance of farmer understanding (Simmons) 8612-5, 8688-90.

Should be especially suited to agriculture (Simmons) 8639-41.

Very essential subject, but should be treated differently to what it is at present (Hall) 1527-8, 1544-6, 1620-7.

Chemistry :

An understanding of, is a necessity to a farmer (Voelcker) 13983-5.

Analyses, *see that title.*

Has been adequately treated in the agricultural colleges (Voelcker) 13980.

Not worth while sending lad to a college to acquire knowledge which he can obtain much better from an analyst for half-a-guinea (Eady) 9360, 9408-9.

Cider-making :

Importance and extent of the cider and cider fruit industry (Barker) 8447-56, 8479, 8484-9.

Dairying :

Amount of produce spoilt by students (Blackshaw) 1695-701; (Ward) 4506-11, 4543-5, 4569-71.

As to the advantage of having a creamery in connection with an institution giving instruction in dairying (Ashcroft) 2429-33, 2457; (Benson) 2521-7, 2594-6.

Butter-judging at shows (Benson) 2575-8.

Comparison between supply of dairy education twenty-five years ago and the present time (Ashcroft) 2338-45, 2436-9, 2443.

Importance of keeping milk records and of the method of milking (Ashcroft) 2484; (Percival) 4265-75; (Turner) 7938-44.

Importance of packing (J. A. Smith) 14575-81.

Increased demand for instruction in (Benson) 2157-20.

Influence that instruction in dairying has had over the attitude of farmers to agricultural education generally, *see under* Attitude of Agriculturists.

Instruction is often of too local a character (McCracken) 9257-60.

Need for further instruction (Ashcroft) 2437-40; (Tinniswood) 7134-40.

Practical work is not a sufficient training; should be followed by theoretical work (Benson) 2561-2.

Sterilising and pasteurising milk, as to the need for instruction in (Ashcroft) 2430-3, 2474-6.

Suggests that it would be better for a county to subsidise competent butter and cheese makers and send pupils to their dairies than to give instruction by means of itinerant instructor (Stiby) 12602-6.

System of travelling teacher should be considerably extended (Brooke-Hunt) 15620; (Dugdale) 4902.

Travelling dairy classes, which were at one time very fully taken up, have since been rather dropped (Brooke-Hunt) 15620.

Whether butter-making can be made profitable (Crooke) 4747-51, 4830-3.

Subjects of Instruction—cont.

Dairying—cont.

Effect of Instruction :

- Audience not always composed of those who would make use of instruction given (*Eady*) 9414-5.
 Farmers have been enabled to meet the requirements of the present day (*Davies*) 8322-5.
 Improvement in butter trade as result of instruction (*Tinniswood*) 7174-81.
 Instruction has been of very real value (*Brooke-Hunt*) 15620-2.
 On prices realised (*Eady*) 9359 ; (*Grant*) 10330-10332 ; (*Hale*) 13319-24, 13352-71, 13453-63 ; (*Phipps*) 9165-8 ; (*Porter*) 13600-4.
 Quality of butter has improved where instruction has been given (*Eady*) 9358-9, 9419.

Drawing :

- Importance of, to agricultural student (*McCracken*) 9248-56.

Farriery :

- Instruction should go on continuously (*Eve*) 13026.
 Provision should be made in every county for instruction in (*Brooke-Hunt*) 15633-7 ; (*Sheather*) 10785-8, 10869-83, 10887-91.
 Teaching of, most expensive (*Sheather*) 10764.
 Veterinary surgeons have been pleased that instruction in, has been provided (*Wheatley*) 12939-41.

Effect of Instruction :

- Art of horse-shoeing has improved in the last 25 or 30 years (*Sheather*) 10777-80, 10823-8, 10861-6.
 Farmers greatly appreciate instruction in (*Acland*) 2756-7 ; (*D. T. Cowan*) 5207a, 5217-8.
 Improvement in horse-shoeing very marked (*Wheatley*) 12921, 12925-6, 12929, 12934-6, 12948.
 In counties where instruction has been given a better knowledge of shoeing is to be observed (*Eve*) 13026-7 ; (*Sheather*) 10792-4.
 Value of instruction (*Hobhouse*) 14965-6 ; (*Simmons*) 8679-81 ; (*Wheatley*) 12944-6, 12948-50.

Methods of Instruction :

- Best results can only be obtained by instructing farriers before they commence work (*Sheather*) 10794-9.
 Can only be taught by manipulation (*Wheatley*) 12914.
 Lectures are not of real benefit to the actual worker (*Sheather*) 10768, 10821-2.
 Question as to how far scientific instruction is suitable for smiths (*Sheather*) 10783-4.
 Various methods of instruction—travelling van, migratory instructor, permanent school, and apprenticeship—compared (*Sheather*) 10794-9, 10806-7, 10817-8.

Students :

- Attitude of smiths towards instruction (*Brooke-Hunt*) 15633 ; (*Sheather*) 10806-7, 10828, 10884-6 ; (*Wheatley*) 12930-2.
 Not necessary for agricultural students to learn farriery (*Mannington*) 2085-91, 2127-9.
 Type of (*Sheather*) 10800-5 ; (*Wheatley*) 12942.

Forestry :

- Importance of instruction in (*Davies*) 8401-4.
 Instruction in, requires developing in the South of England (*Dunstan*) 1936-40.
 Scope for advisory work (*Foulkes*) 5914-7.

Geology :

- Too much time spent on geology of strata as opposed to surface geology (*Swanwick*) 7638-9, 7752-3, 7756-7.

Horticulture :

- Distinctly profitable industry (*Brooke-Hunt*) 15641-3.
 For women, see under Women.
 French system of early vegetable production (*Crooke*) 4694d, 4820-1.
 Instruction in grading and packing (*Faithfull*) 5356-62, 5399-400 ; (*Keeble*) 4400, 4434-40 ; (*Miller*) 9601-9, 9622-3, 9628 ; (*W. P. Wright*) 10172-3, 10261-6.

Subjects of Instruction—cont.

Horticulture—cont.

- Private gardeners as a class have not much scientific knowledge and their general education is often insufficient (*W. P. Wright*) 10151-2, 10156-70, 10213-9, 10252-9, 10278-80.
 Question of giving advice and assistance to owners of private gardens (*Goaring*) 11095-9.

Need for further provision :

- Fruit stations, more, are required in suitable districts (*Brooke-Hunt*) 15653-4 ; (*Goaring*) 11065-7 ; (*W. P. Wright*) 10176, 10183.
 Further funds required to assist instruction in horticulture and the distribution of literature (*W. P. Wright*) 10194-6, 10201-12.
 Instruction should be given in every county and encouraged in every way (*Brooke-Hunt*) 15640-3.
 More travelling lecturers required for benefit of those who cannot attend courses at a college (*Goaring*) 11063-5.
 Some county councils are doing good work by providing gardens for elder lads and young men, and the system should be extended (*Brooke-Hunt*) 15649-52.
 Suggests that at each college a small tract of land should be reserved for the growing of fruit and vegetables on a commercial scale, and the students taught business methods (*Goaring*) 11073-9, 11090-2, 11105-7.

Value of the Instruction :

- Does not approve of instruction in horticulture (*Stiby*) 12616-27, 12690-7.
 Money not always well spent (*Hall*) 1597.
 Offering of prizes often has as good an effect as the giving of instruction (*Simmons*) 8662-6.
 Results of instruction are very great (*Brooke-Hunt*) 15640-1 ; (*Carrick*) 464-71 ; (*Davies*) 8270 ; (*Roberts*) 8119a, b.
 Scientific knowledge is of great importance (*W. P. Wright*) 10153-6.
 Very valuable work has been done during the past 16 years (*W. P. Wright*) 10119-20.

Manual Processes :

- How instruction could be extended, and the importance of it being extended (*Alltoft*) 10633-9, 10729, 10745.
 Instruction must be given if the county council spends money on prizes (*Inskip*) 3419-20.
 Men are not anxious to take up work of this character (*Alltoft*) 10693-709.
 Older men seem averse to teaching the younger ones (*Acland*) 2736.
 Students, number of, passed through the hands of one instructor (*Alltoft*) 10737-9.
 Type of student and their after-careers (*Alltoft*) 10628, 10644-5, 10648-51, 10681-10684, 10691-2, 10710-3, 10719-28, 10750-10753.
 Teacher, the type of man (*Acland*) 2795-802 ; (*Alltoft*) 10729-36.
 Various subjects taught (*Alltoft*) 10612-6, 10646-10647, 10671-5, 10686-9.
 Care of farm machinery, elementary instruction in the principles of mechanics should accompany instruction in the (*Swanwick*) 7632.
 Interest taken in instruction by students (*Swanwick*) 7631-2.
 Draining, considered a "landlord's job" ; no demand for instruction from labourers (*Druce*) 3643-7.
 Little draining being carried out (*Langridge*) 10910-1.
 Under-draining going out in the South of England (*Alltoft*) 10646-7.
 Value of instruction in (*Druce*) 3783-8.
 Hedging, "live" hedges are not dearer than wire fencing (*Alltoft*) 10740-1.
 Management of sheep, number of lambs reared is not the only indication of an efficient shepherd (*Stiby*) 12708-12.
 Thatching is dying out (*Alltoft*) 10656-9, 10743-4.

Organisation and Method of Instruction :

- Absolutely necessary that there should be prizes (*Eve*) 13091-4.

Subjects of Instruction—cont.**Manual Processes—cont.****Organisation and Method of Instruction—cont.**

Excellent results have followed from small society giving prizes for good work (*Simmons*) 8631-8.

How classes are organised (*Alltoft*) 10652-5.

Length of instruction (*Alltoft*) 10609-11.

May be necessary to organise and to systematize the instruction (*Brooke-Hunt*) 15638.

Method of instruction (*Alltoft*) 10620-4, 10716-10718.

Needs a great amount of superintendence to prevent waste (*Acland*) 2720a, 2737-40.

Number in class (*Alltoft*) 10617-9.

Prizes might be given by agricultural society (*Brooke-Hunt*) 15639.

Should be taught by sending young men with the older ones to get instruction (*Eady*) 9369-9373, 9447-68.

Suggests that no instruction should be given, but the money spent in giving premiums to lads who have been instructed (*Stiby*) 12633-12638, 12649-50.

Taught by means of apprenticing boys to practical experts (*Wheeler*) 6416-9.

Whether it is necessary to provide an instructor for the purpose (*Alltoft*) 10661-3, 10676-80; (*Fisher*) 3007, 3032; (*Stiby*) 12717-20; (*Swanwick*) 7730-3; see also (*MacDonald*) 11848-50.

Value of the Instruction :

Appreciated by farmers and men (*Acland*) 2720a, 2739-40; (*Alltoft*) 10625-8.

Every county council should encourage instruction (*Eve*) 13087-94.

Good results which have followed from instruction (*Grant*) 10357.

Importance of instruction being continued (*Alltoft*) 10640-4.

Instruction is doing a great deal of good and should be encouraged (*Brooke-Hunt*) 15638-9.

Need of instruction because it is difficult at present time to get farm work done (*Chris. Middleton*) 12828-32.

Unfavourable opinion as to the instruction (*Hall*) 1597a.

Meteorology :

Attitude of agriculturists towards meteorology and meteorological forecasts (*Mill*) 6327, 6345-6346, 6382-7, 6388-95, 6398.

Cost of instruments for use by ordinary farmer (*Mill*) 6360-1, 6374-7.

Farmers should have a sufficient knowledge of, to grasp the bearings of the Weekly Weather Report (*Mill*) 6302-6, 6316, 6339, 6355-6, 6371-2, 6384, 6387, 6398.

Importance of instruction in, being given at agricultural colleges (*Mill*) 6315-8, 6322, 6339-6341.

Suggestion for increasing the instruction in, at agricultural colleges (*Mill*) 6319-21, 6323-4, 6370-3, 6378-82.

Value of meteorology (*Dunstan*) 825, 840-3.

Poultry-keeping :

Commencement of systematic instruction in (*Brown*) 6155a.

Experimental work, need for further (*Brown*) 6171f, 6222-4, 6248-52.

Great demand for men qualified in (*Brown*) 6171c. Has been, and could still be, great increase in number of poultry kept in this country (*Brown*) 6254-8.

Institutions at which instruction is given (*Brown*) 6155h.

Instruction in, abroad (*Brown*) 6165b.

Instruction should be encouraged as much as possible (*Brooke-Hunt*) 15623-5.

Lectures require to be supplemented by advanced teaching (*Brown*) 6155c.

Length of course desirable for full instruction (*Brown*) 6172-3.

Need for poultry-stations for experimental work (*Brooke-Hunt*) 15623.

No one can succeed in poultry-keeping without a knowledge of general agriculture; does not believe in poultry-farming by itself (*Brown*) 6172, 6282, 6290-1.

Very valuable results have followed from instruction in (*Brooke-Hunt*) 15623-5; (*Chris. Middleton*) 12821-3.

Subjects of Instruction—cont.**Veterinary Hygiene :**

Absolutely essential that a farmer should have a knowledge of veterinary science, especially in regard to the recognition, causes and prevention of disease (*Cave*) 9498.

Farmers greatly appreciate instruction in (*Brookholes*) 13783-4; (*Chris. Middleton*) 12824, 12833.

Instruction has been of great value (*Amos*) 890, 913-5, 931-3; (*Brooke-Hunt*) 15627-32; (*Chris. Middleton*) 12824.

One of the objects of the instruction is to do away with old-fashioned methods and "quack" remedies (*Cave*) 9559-66.

Teaching of, at an agricultural college is of great use (*Cave*) 9490.

Very good thing if every farmer could be taught the elements of what may be called veterinary physiology and hygiene (*McFadyean*) 9723a, 9724a, c, 9726-9.

Attitude of Veterinary Profession towards such Instruction :

Always avoids giving farmers information on actual treatment (with examples showing attitude taken up with regard to certain diseases) (*Cave*) 9498-500, 9518, 9527-36, 9541-4, 9549-57, 9567-73, 9571-3.

Has always felt himself limited by having regard to "professional etiquette," but has seldom found any difficulty arise with local veterinary surgeons (*Cave*) 9523-6, 9541-8.

Never found any difficulty arise (*Acland*) 2746-2748; (*Blackshaw*) 1736; (*Brooke-Hunt*) 15627; (*Burne*) 5628; (*Phipps*) 9173-5.

Not either necessary or advisable to teach farmers anything whatever with regard to treatment of animals (*McFadyean*) 9723b, 9725b.

Opposition is not now so strong (*Gilchrist*) 698-703.

Opposition was raised by inserting an advertisement in local paper offering to receive patients for the college hospital (*McClellan*) 9980, 9982; see also (*Cave*) 9537-40.

There is a little jealousy (*Amos*) 913.

SURREY.

See also under South-Eastern Agricultural College.

Bee-keeping :

Instruction given through the Surrey Bee-Keepers' Association (*Reid*) 14601-3, 14608, 14675-7.

Instruction has been most beneficial (*Reid*) 14622. Lectures and demonstrations, and personal advice (*Reid*) 14612-3, 14678.

Work with regard to "foul-brood" (*Reid*) 14607, 14610, 14656-7.

SURVEYORS' INSTITUTION.

Evidence received from (*Langridge*) 10893-11025, representing the Institution.

Examinations leading up to Fellowship of the Institution (*Langridge*) 10901-13, 10957-60, 10968-70.

Great increase in the number of candidates (*Langridge*) 10961-5.

Students from agricultural colleges are preferred to those taught privately (*Langridge*) 10966-7.

Scholarships tenable at certain agricultural institutions (*Langridge*) 10896-901, 10970-7.

SUSSEX, EAST. See under Uckfield Agricultural and Horticultural College.**SUSSEX, WEST.**

Evidence received principally from (*Drewitt*) 12014-12173.

Attitude of agriculturists and the County Council towards agricultural education (*Drewitt*) 12029, 12031-3, 12051-2, 12061-2a, 12066, 12069-70, 12072-3, 12085-90, 12100, 12105-6, 12108-12, 12124-5, 12161-5, 12173.

Classes have been held in the following subjects, but were subsequently abandoned, largely owing to lack of interest:

Dairying (*Drewitt*) 12021-4, 12028.

Farriery (*Drewitt*) 12084-90.

Horticulture (*Drewitt*) 12045-9.

and Scholarships were offered (*Drewitt*) 12067-76,

Sussex, West—cont.

Education Committee, some members of, wished to start instruction in forestry (*Drewitt*) 12029-30, 12034-9.

Farmers' sons are to a great extent not becoming farmers; and farms, as they become vacant, are taken by men from other counties (*Drewitt*) 12040-4, 12063-6.

Previous to the Education Act of 1902 the "whisky money" was spent chiefly on art classes, &c., but it is now being utilised for pupil-teachers' centres and secondary education (*Drewitt*) 12028, 12056-60, 12077-83, 12118-27.

School gardens are now provided at certain elementary schools (*Drewitt*) 12137-9.

South-Eastern Agricultural College, Wye, the question of connection with, was at one time considered (*Drewitt*) 12131-2.

Suggests that an experimental station in the county would arouse interest and create desire for further instruction (*Drewitt*) 12053-5, 12092-9, 12106, 12129-31, 12171.

See also under Uckfield College.

SUTTON, Mr. M. J. *Member of the College Council of the University College, Reading.*

Evidence, 4015-4106.

SWANLEY HORTICULTURAL COLLEGE, KENT.

Evidence received principally from (*Wilkinson*) 11556-11676.

Buildings and land attached to College (*Wilkinson*) 11632-4.

Governing Body (*Wilkinson*) 11566-71, 11655, 11667-8.

Courses of Instruction (*Wilkinson*) 11572-82, 11586-11594, 11625.

Elementary school teachers, *see that title*.

Instruction in practical horticulture is excellent, but the scientific side requires strengthening (*Dunstan*) 1915-7.

Students are well trained (*T. W. Cowan*) 14826-9.

Financial Position (*Wilkinson*) 11557-61, 11629, 11674-5.

Anxious to receive grants from Board of Agriculture (*Wilkinson*) 11643-52.

Scholarships tenable at (*Wilkinson*) 11635-8.

Staff (*Wilkinson*) 11591, 11626-31.

Inadequately paid (*Wilkinson*) 11629.

Students :

Fees (*Wilkinson*) 11595.

Number of (*Wilkinson*) 11596-7, 11662.

Residential accommodation for (*Wilkinson*) 11564-5.

Type of student and their after-careers (*Wilkinson*) 11562-3, 11577, 11592-3, 11598-611, 11613, 11619-20, 11623, 11635-7, 11658, 11660-1, 11663-6, 11669-73, 11675.

Course at the College is useful to women whether they marry or not (*Wilkinson*) 11611.

COLONIAL BRANCH.

Evidence received principally from (*Mrs. Hopkinson*) 11677-11757.

Aim of (*Mrs. Hopkinson*) 11678.

Colonial societies, &c., from whom assistance is received (*Mrs. Hopkinson*) 11719, 11750, 11753, 11756.

Governing Body (*Mrs. Hopkinson*) 11698-700.

History of the formation of (*Mrs. Hopkinson*) 11678, 11691-2, 11695.

Courses of Instruction (*Mrs. Hopkinson*) 11680, 11686-90, 11705, 11735-8, 11745, 11748-9, 11756-7.

Financial Position (*Mrs. Hopkinson*) 11691-4, 11728-34, 11741-4.

Money required to improve equipment (*Mrs. Hopkinson*) 11725-7.

Staff (*Mrs. Hopkinson*) 11756.

Swanley Horticultural College, Kent—cont.**Colonial Branch—cont.****Students :**

Fees (*Mrs. Hopkinson*) 11713-4.

Number of (*Mrs. Hopkinson*) 11683, 11702, 11735-7.

Applications vary greatly in number (*Mrs. Hopkinson*) 11750.

Residential accommodation for (*Mrs. Hopkinson*) 11682-4.

Type of student and their after-careers (*Mrs. Hopkinson*) 11696-7, 11702-4, 11706-11712, 11716-7, 11720-4, 11739-40, 11746-11747, 11754-5.

SWANWICK, Mr. BRUCE. *Member of the Agricultural Committee of the Gloucester County Council* (Qualifications of the witness, *see* 7611, 7676-7, 7686-7, 7739, 7750-1, 7768-71.)

Evidence, 7585-7771.

TINNISWOOD, Mr. ROBERT. *Alderman of the Cumberland County Council.* (For information as to own farm, *see* 7129, 7131, 7148.)

Evidence, 7112-7216.

TURNER, Mr. DRYSDALE. *Director of Agricultural Instruction to the Gloucester County Council.* (Qualifications of witness, *see* 7774-6.)

Evidence, 7772-7839, 7869-8050.

TURNOR, Mr. CHRISTOPHER. *Representative of the County Councils' Association.* (Qualifications of witness, *see* 14221-30, 14293-4, 14372-5.)

Evidence, 14221-14485.

UCKFIELD, AGRICULTURAL AND HORTICULTURAL COLLEGE AT.

Evidence received principally from (*Mannington*) 1972-2153; (*Woodhead*) 2154-2335.

Attitude of County Council towards the College (*Goaring*) 11049-51; (*Mannington*) 1990-1, 2088-9.

Board of Agriculture, relations with (*Mannington*) 2018-20, 2103-6.

Governing Body (*Mannington*) 1973-4, 2008-20.

Scope for development (*Mannington*) 2030-1, 2079-2083.

West Sussex, relations with (*Mannington*) 2003-7, 2021-4, 2136; (*Woodhead*) 2220-1.

Analysis (*Mannington*) 2125-6, 2147-9; (*Woodhead*) 2299-303.

Attitude of Agriculturists towards, *see that title*.

Courses of Instruction (*Mannington*) 1985, 2059-65, 2084-90, 2135-6; (*Woodhead*) 2154-70, 2201-7, 2229-51, 2311-3, 2328-9.

Elementary School Teachers, *see that title*.

Horticulture (*Goaring*) 11031, 11080-4, 11108-9.

Need for a short course for farmers' sons (*Woodhead*) 2168-70, 2229-36.

No outside examiners (*Woodhead*) 2258-63.

External Work :

Experiments (*Mannington*) 1981-2, 2003-5, 2209-2210.

Horticulture (*Goaring*) 11031-6, 11071, 11100-4.
Fruit stations (*Goaring*) 11043-9; (*Mannington*) 2001.

Lectures (*Mannington*) 1996-8, 2003-5, 2073-4, 2121-4, 2144-6; (*Woodhead*) 2178-80, 2183-8.

Farm (*Mannington*) 1983-4, 2026-9, 2036-7, 2135-7.

Finance :

Additional grant from the Government would materially strengthen position of the College (*Mannington*) 2034-6.

Sources of income (*Mannington*) 1991-5, 2006, 2037-44; (*Woodhead*) 2324-6, 2332-3.

Scholarships tenable at (*Mannington*) 2142-3; (*Woodhead*) 2314-22.

Staff (*Woodhead*) 2193, 2304-5.

Require an additional agricultural lecturer (*Mannington*) 1996.

Uckfield, Agricultural and Horticultural College at—cont.**Students :**

Fees (*Mannington*) 1986-7, 2141; (*Woodhead*) 2323.

Higher, charged to students from outside the county (*Mannington*) 1986-7; (*Woodhead*) 2323.

Number of (*Mannington*) 2057-8, 2071; (*Woodhead*) 2171-2, 2296-8, 2306-10.

Previous education of, *see that title*.

Type of student and their after-careers (*Goaring*) 11085-9; (*Langridge*) 10916; (*Mannington*) 1986-9, 2070-2, 2119-20, 2136-8; (*Woodhead*) 2173-6, 2194-9, 2227-8, 2273-91, 2334-5.

UNITED STATES OF AMERICA. *See under*
Colonial and Foreign Countries.

UNIVERSITIES AND UNIVERSITY COLLEGES.
See under Institutions.

VETERINARY EDUCATION.

For information as to the instruction in veterinary matters given to farmers and students at agricultural colleges, see Subjects of Instruction—Veterinary Hygiene.

Assistance given by colonial and foreign Governments to (*McFadyean*) 9703, 9712; (*T. H. Middleton*) 15464-7.

Government assistance to veterinary colleges is absolutely necessary if veterinary education—which is of the greatest importance to agriculture—is to attain in this country the level already attained in most continental States and to march on that level (*McFadyean*) 9695-706, 9744-9, 9754.

May be said to date from the latter part of the 18th century (*McFadyean*) 9674-5.

Royal Veterinary College, *see that title*.

Students can now obtain the London University Degrees of B.Sc. and D.Sc. in Veterinary Science (*McFadyean*) 9689-90.

Veterinary colleges are precisely in the same relation to the State, as regards the need for State aid, as medical schools (*Ogilvie*) 15928-30.

VETERINARY HYGIENE. *See under* Subjects of Instruction.

VICTORIA UNIVERSITY. *See* Manchester University.

VOELCKER, Mr. J. A., M.A., B.Sc., Ph.D. *Chemist of the Royal Agricultural Society of England.* (Qualifications of witness, *see* 13975-7, 13994-5.)

WESTMORLAND COUNTY COUNCIL. *See under* Newton Bigg, Cumberland and Westmorland Farm School.

WHEATLEY, Mr. ALBERT, F.R.C.V.S., of Berkshire. (Qualifications of witness, *see* 12916, 12925, 12937-12938.)
Evidence, 12909-12950.

WHEELER, Mr. E. VINCENT V. *Vice-Chairman of the Worcester County Council.*

Evidence, 6399-6479.

WILKINSON, Miss. *Principal of the Horticultural College, Swanley.*

Evidence, 11556-11676.

WILKS, Rev. W., M.A. *Secretary to the Royal Horticultural Society.*

Evidence, 13902-13974.

WILTSHIRE.

Evidence received principally from (*Fitzmaurice*) 7840-7868; (*Phipps*) 8980-9205.

Agricultural Education Committee :

History of the appointment, and the powers of (*Fitzmaurice*) 7840a, c, f, 7841-3, 7848-9; (*Phipps*) 9050-60.

For information as to the establishment in other countries of similar committees, see Organisation—County Councils.

Attitude of the County Council and ratepayers towards expenditure on agricultural education (*Fitzmaurice*) 7840b-e, 7844, 7846-7; (*Phipps*) 9059.

Dauntsey Agricultural School, *see that title*.

Good work is being done in (*Beaven*) 14167-9.

No agricultural lectures, experiments, or forestry instruction (*Phipps*) 9087-98, 9125-8.

Attitude of Agriculturists, *see that title*.

Dairying :

Cheese school (*Phipps*) 8985-99, 9146-54.

Fees charged (*Phipps*) 8993-6.

Why the school was abandoned (*Fitzmaurice*) 7844a, 7845.

Travelling dairy school (*Phipps*) 9000-17, 9111-7, 9138-45, 9155-68.

Students, type of (*Phipps*) 9010.

Elementary School Teachers, *see that title*.

Farriery and Veterinary Science (*Phipps*) 9018-27, 9169-76.

Fees charged (*Phipps*) 9022.

Finance :

Board of Education, application to, for a grant (*Phipps*) 9082-3, 9189-93.

Receive little by way of grants (*Fitzmaurice*) 7846, 7850.

Work has been curtailed owing to want of funds (*Phipps*) 9025-30, 9036, 9123-8 9183-6, 9188.

horticulture (*Phipps*) 9031-5, 9037-41, 9088-91.

Manual Processes (*Alltoft*) 10639, 10664-70; (*Phipps*) 9027-30, 9042-9, 9101-4.

Prizes given by Hunt Committee (*Alltoft*) 10757-8.

For details of the instruction in manual processes refer to Subjects of Instruction, Manual Processes, *evidence by* Mr. Alltoft.

Poultry-keeping (*Phipps*) 9036.

Scholarships awarded (*Phipps*) 9066-77, 9099-101, 9177-82.

Staff (*Phipps*) 8985-8, 9002-3, 9015-6, 9020, 9025-6, 9032, 9036, 9064, 9203.

WINTER, Professor T. *Professor of Agriculture, University College of North Wales, Bangor.* (Qualifications of witness, *see* 6651.)

Evidence, 6650-6906.

WOMEN, Instruction in Agriculture and Horticulture for.

Agricultural education is not taken seriously enough by women students and teachers (*Bradley*) 8798-9, 8801-2, 8804, 8841-2.

Co-operation, essential for (*Bradley*) 8811-6.

Women are not in favour of co-operation (*Bradley*) 8769.

Difficult for women to get into market gardens as working pupils (*Miller*) 9604-9.

Horticulture can be made to pay (*Keeble*) 4402-6; (*Miller*) 9594-8.

Importance of women being properly trained (*Crooke*) 4694a, 4770-5; (*Miller*) 9599-600.

Women, Instruction for—cont

It is necessary that agriculture or nature-study should receive a definite place in the school curriculum beginning from the elementary school (*Bradley*) 8758b-66, 8843-9.

Openings for women in agriculture and horticulture, and opinion as to their comparative value, with examples of where success has been attained (*Bradley*) 8752-8a, 8765, 8773-81, 8785-7, 8799a-8800, 8805-18, 8819-37, 8854; (*Crooke*) 4694b, 4793-6, 4801-16, 4834-8; (*Dugdale*) 4944-8, 4996-4999; (*Faithfull*) 5345-52; (*Keeble*) 4402-10; (*Miller*) 9636-42, 9663-73; (*Wilkinson*) 11612-24, 11661.

University degrees in agriculture should be open to women (*Bradley*) 8764, 8789-97.

WOOD, Mr. T. B., M.A. *Reader in Agricultural Chemistry and Secretary to the Department of Agriculture, University of Cambridge.* (Qualifications of witness, see 52-55.)

Evidence, 1-238.
